Systems Science Addressing Global Issues:

Systems Science Frank A. Stowell, Daune West, James G. Howell, 2012-12-06 As we approach the end of the 20th century we can look back upon the achievements that have been made in a variety of human endeavours with pride. Enormous strides have been made to improve the quality of life of millions of people through the application of the scientific discoveries made during this and past centuries. The 20th century will be remembered as much for the mass exploitation of scientific discovery as for the discoveries themselves. The technological age has meant that the human being is able to contemplate activities which defy nature. For example, some of the work involved in the preparation of these proceedings has been done whilst travelling at over 500 miles per hour, seven miles above the surface of the earth. It is not difficult to conjecture about the effect that this relatively recent technology has had upon a number of systems. Air transportation has provided a number of benefits including such disparate examples such as enabling holidays, famine relief and the cross fertilisation of cultural practices from other lands. Equally, there have been undesirable effects such as enabling the means of mass destruction, interference in other cultures and the speedy transportation of disease. Moreover, the physical presence of the aeroplane itself represents the consumption of fossil fuels, a source of pollution and a change in the way we think about life. The view expressed here is of course the view of an inhabitant of the western world.

Critical Issues in Systems Theory and Practice

K. Ellis, Amanda J. Gregory, B.R. Mears-Young, Gillian Ragsdell, 2013-06-29 The systems movement, now 40 years old, is made up of many associations of systems thinkers from different disciplines all over the world. The United Kingdom Systems Society (UKSS) was formed in 1978. Today it has over 300 members and is committed to the development and promotion of systems philosophy, theory, concepts and methodologies for improving decision making for the benefit of organizations and wider society. The first UKSS International Conference was held at the University of Hull in July of Huddersfield, 1989. Since then we have held International Conferences at the Universities of Hull (1991) and Paisley (1993). The UKSS International Conferences are now an established biannual event and this, our fourth international conference, will be jointly hosted by the Universities of Hull and Humberside. Systems science is considered to be a trans-discipline which promotes critical and effective intervention in complex organisational and social problem situations. As such, it traverses hard through soft to critical systems thinking and methodologies. Yet, despite the currently robust state of the UKSS, the systems movement cannot be described as an international movement. Different sub-disciplines are at different stages of development and are often engaged in pursuing their own particular interests and themes with little conversation between the sub-disciplines despite their common interest in systems.

Cybernetics And Systems '94 - Proceedings Of The 12th European Meeting On Cybernetics And Systems Research (In 2 Volumes) Robert Trappl, 1994-03-15 The papers in this volume reflect the most recent research findings in cybernetics and systems research. They were selected from 298 draft final papers which were submitted to the conference by authors from more than 30 different countries from five continents.

Systems for Sustainability Frank A. Stowell,Ray L. Ison,Rosalind Armson,Jacky Holloway,Sue Jackson,Steve McRobb,2013-11-11 The term sustainability has entered the lexicon of many academic disciplines and fields of professional practice but to date does not appear to have been seriously considered within the systems community unless perhaps under other guises Within the wider community there is no consensus around what sustainability means with some authors identifying 70 to 100 definitions of the term Some see sustainability as the precise and quantifiable outcomes of biological systems whilst others see it in terms of processes relevant to personal and organizational change with the potential to effect changes in our relationships with our environments Internationally it has been increasingly used in relation to the term sustainable development a term popularised by the Brundland Commission of definitions report in 1987 entitled Our Common Future Despite this diversity and polarised perception on its utility unlike many other popular terms it has not had its time and subsided quietly from our language It is therefore timely for the systems community to explore the relationship between systems and sustainability in a range of contexts Participants in this the 5th International Conference of the United Kingdom Systems Society UKSS have been invited to reflect critically on the contribution of systems thinking and action to sustainability to the sustainability of personal relationships the organizations in which live and work and our natural environment
