Somatic Cell Genetics:

The Cells of the Body Henry Harris,1995 This book is the first scholarly history of research into the genetics of body cells from its origins in the 19th century to the present day Henry Harris a well known writer and a distinguished investigator in cell biology and cancer genetics brings an unusually informed perspective to the technical aspects of his subject He has written a book to be enjoyed not just by professional historians of science but by working scientists in genetics cell biology and cancer research from the graduate student level upwards Its readers will derive a richer understanding of how and why the cells of the body are studied in the way that they are today

Techniques in Somatic Cell Genetics Jerry W. Shay,2013-11-21 Somatic cell genetics is an exciting and rapidly expanding field of research Since descriptions of the major experimental techniques in the field are scattered throughout various journals and other publications there is a real need for a single reference source for both established investigators and students in the field In addition technical reports are frequently abridged such that many researchers are discouraged from attempting to adopt the appropriate methodology This book therefore describes in detail the many recent technical advances in such areas of somatic cell genetics as transfer mediated by liposomes erythrocyte ghosts chromosomes micro cells mitochondria and isolated nuclear DNA These techniques have increased our understanding of the organization and regulation of eukaryotic cells The production of antibiotic resistant cell lines and their use in studying cytoplasmic inheritance are also included Evidence for the cytoplasmic regulation of nuclear gene expression in eukaryotic cells is rapidly accumulating following the characterization of cytoplasmic mutations The production of nuclear coded mutations their use in standard cell hybridization and recent advances in techniques for fusing whole cells or cell components are also described

Somatic Cell Genetics of Woody Plants M.R. Ahuja,2012-12-06 Most forest tree species were considered recalcitrant a decade ago but now with the improved in vitro techniques some progress has been made towards culture of tree species Micro propagation has been achieved from the juvenile tissues of a number of forest tree species On the other hand tissues from most mature trees are still very difficult to grow and differentiate in vitro Nevertheless there has been slow but steady progress in the application of tissue culture technology for culture of tissues organs cells and protoplasts of tree species As compared to most agricultural crops and herbaceous plant species trees are a different lot They have long generation cycles They are highly heterozygous and have a large reservoir of genetic variability Because of this genetic variability their

response in vitro is also variable. On a single medium the response of tissues from different trees (genotypes of a single species) may be quite different, some responding by induction of growth and differentiation while others showing minimal or no growth at all. That makes the somatic cell genetics of woody plants somewhat difficult but at the same time interesting.

Somatic Cell Hybrids Abbott, Catherine M. Abbott, Povey, 1995-03. Describing the background to a technique widely used in human genetics, this study analyzes the uses of a particular type of cell culture. These uses include the mapping of human genes, a key aspect of the human genome project.

New Techniques in Somatic Cell Genetics Alan Garth Tunncliffe, 1984. *Cell Culture and Somatic Cell Genetics of Plants* I. K. Vasil, 1984. *Eukaryotic Cell Genetics* John Morrow, 2012-12-02. *Eukaryotic Cell Genetics* reviews the state of knowledge in somatic cell genetics. The book begins by discussing the development of somatic cell genetics, focusing on the estimation of mutation rates in mammalian cells, with frequent reference to the use of drug resistance as a selective character. It then considers some of the specific properties of such variants in order to understand their molecular basis. The subsequent chapters examine the properties of specific types of auxotrophic variants, the means by which eukaryotic cells may be reassembled to give rise to viable cellular composites, gene regulation in eukaryotic organisms, and chromosome mapping. The discussions also include differentiation in cultured cells, neoplastic transformation, the modulation of gene expression in cultured cells, mutation induction in cultured cells, applications of cell culture, and the mechanism of cellular aging. This book is intended for researchers in the fields of genetics and molecular biology, nonspecialists interested in what is happening in a very exciting area of biology, and students at the graduate level in cell biology.

Somatic Cell Genetics and Molecular Genetics of Trees M.R. Ahuja, Wout Boerjan, David B. Neale, 2012-12-06. This proceedings is based on a joint meeting of the two IUFRO International Union of Forestry Research Organizations Working Parties: Somatic Cell Genetics S2 04 07 and Molecular Genetics S2 04 06, held in Gent, Belgium, 26-30 September 1995. Although a joint meeting of the two Working Parties had been discussed in the past, this was the first such meeting that became a successful reality. In fact, this meeting provided an excellent forum for discussions and interactions in forest biotechnology that encouraged the participants to vote for a next joint meeting. In the past decade, rapid progress has been made in the somatic cell genetics and molecular genetics of forest trees. In order to cover recent developments in the broad area of biotechnology, the scientific program of the meeting was divided into several sessions. These included somatic embryogenesis, regeneration, transformation, gene expression, molecular markers, genome mapping, and biotic and abiotic stresses. The regeneration of plants produced by organogenesis or somatic embryogenesis is necessary not only for mass cloning of forest trees but also for its application in genetic transformation and molecular biology. Although micropropagation has been achieved from juvenile tissues in a number of forest tree species, in vitro regeneration from mature trees remains a challenging problem in most hardwoods and conifers. The mechanisms involved in the transition from juvenile to mature phase in woody plants are poorly understood. This transition can now be investigated at the molecular level.

Plant Improvement and Somatic Cell Genetics Indra Asil, 2012-12-02 Plant Improvement and Somatic Cell Genetics includes all but one of the papers presented at two symposia held during the XIII International Botanical Congress in Sydney Australia on August 21-28 1981 *Frontiers in Plant Breeding and Cell Culture and Somatic Cell Genetics in Plant Biology* highlight the ways in which plant breeding techniques can improve crops The book explores the potentials as well as the limitations of plant breeding and cellular and molecular techniques in plant improvement Comprised of 14 chapters this volume begins with an overview of the potential applications of exotic germplasm for tomato and cereal crop improvement It continues with a discussion of multiline breeding breeding of crop plants that can tolerate soil stresses combining genomes by means of conventional methods use of embryo culture in interspecific hybridization use of haploids in plant improvement and somaclonal variation and somatic hybridization as new techniques for plant improvement The reader is also introduced to plant cell culture as well as somatic cell genetics of cereals and grasses somatic cell fusion for inducing cytoplasmic exchange uses of cell culture mutants genetic transformation of plant cells by experimental procedures in the context of plant genetic engineering and use of molecular biology techniques for recognition and modification of crop plant genotypes This book will be a useful resource for scientists and plant breeders interested in applying somatic cell genetics for crop improvement *Chromosomal Gene Assignment by Somatic Cell Genetics, and Molecular Identification of Human Cell Surface Antigens* Heli Suomalainen, 1986 *Somatic Cell Genetics as a Tool for Plant Breeding* Peter S. Development and Application of a General Method for Somatic Cell Genetics Tim Wang (Ph. D.), 2017 Genetic analysis or genetic screening is an efficient method for identifying the set of genes involved in a biological process In microorganisms powerful techniques enable systematic loss of function screens which have yielded critical insights into the molecular basis of many fundamental cellular pathways In human cells however prevailing screening methods fall short leaving our understanding of human genes incomplete Here I describe the development of a general method for genetic screening in mammalian cells using the clustered regularly interspaced short palindromic repeats CRISPR Cas9 system In this approach libraries of knockout mutants can be generated in any cultured cell line using large scale lentiviral single guide RNA sgRNA pools and screened under both positive and negative selection After the initial proof of principle experiments I constructed a

genome wide sgRNA library and screened for genes required for the proliferation and survival of the nearhaploid chronic myeloid leukemia cell line KBM7 The unusual karyotype of these cells also allowed an independent screening approach involving gene trap insertional mutagenesis to find cell essential genes Together these screens converged on a highly overlapping gene set that was enriched for genes that encode components of fundamental pathways are expressed at high levels and contain few inactivating polymorphisms in the human population To broadly survey patterns of human gene essentiality I conducted CRISPR based screens across many more cell lines and cancer types Overall these studies revealed a large set of common essential genes involved in housekeeping processes but interestingly also pinpointed differences specific to each cell line that reflected its developmental origin oncogenic drivers paralogous gene expression pattern and chromosomal structure By mapping sets of genes displaying variable but correlated essentiality across lines I uncovered functionally interacting gene networks Using this dataset I also identified genetic vulnerabilities associated with oncogenic Ras which may be exploited for anti cancer therapy Last in collaboration with Bruce Walker and Nir Hacohen s labs I have conducted a screen for host factors i e human genes that are required to support HIV infection in a physiologically relevant cell line model Collectively these results establish CRISPR based screens as a powerful tool for systematic genetic analysis in mammalian cells
