[Integrable Structures of Exactly Solvable Two-Dimensional Models of Quantum Field Theory](#) S. Pakuliak, G. von Gehlen, 2012-12-06 Integrable quantum field theories and integrable lattice models have been studied for several decades but during the last few years new ideas have emerged that have considerably changed the topic The first group of papers published here is concerned with integrable structures of quantum lattice models related to quantum group symmetries The second group deals with the description of integrable structures in two dimensional quantum field theories especially boundary problems thermodynamic Bethe ansatz and form factor problems Finally a major group of papers is concerned with the purely mathematical framework that underlies the physically motivated research on quantum integrable models including elliptic deformations of groups representation theory of non compact quantum groups and quantization of moduli spaces

**Field Theory of the Two-Dimensional Ising Model: Equivalence to the Free Particle One-Dimensional Dirac Equation** Richard A. Ferrell, MARYLAND UNIV COLLEGE PARK CENTER FOR THEORETICAL PHYSICS., 1972 The Schultz Mattis Lieb Fermion formulation of the two dimensional Ising model is simplified by means of long wavelength approximations which become exact in the critical region The resulting continuum theory has a Hamiltonian density which is shown to be identical to within a perfect derivative to that of free spinless particles satisfying the one dimensional Dirac equation Filling the negative energy single particle states of momentum  $q$  and mass  $k$  gives an integral over the single particle energies  $q^2 - k^2$  to the  $1/2$  power Because  $k$  varies linearly with the temperature differentiating twice gives Onsager's logarithmic singularity in the specific heat

Computer Simulation of a Two Dimensional Ising Model Viviane Jean Khoury,1994 A simulation of phase transition for a two dimensional Ising lattice is performed on a Dell 450 computer A computer program is developed using Turbo Pascal 6 0 to simulate a spin lattice in equilibrium with a heat bath Metropolis algorithm was implemented which uses a simple Monte Carlo sampling scheme and is briefed as follows a lattice configuration of spins is generated and the initial energy of the system computed Then a random trial change in the initial configuration is made If the change in energy  $\Delta E$  of the system is negative or equal to zero the new configuration is accepted If  $\Delta E$  is positive the change is allowed with a transition probability The physical quantities of interest such as the mean energy mean magnetization specific heat capacity and the susceptibility are obtained and their variation with time temperature and lattice size is studied Difficulties arose when it was found out that the temperature dependence of the mean magnetization specific heat and susceptibility of our simulated system is independent of the lattice size The results obtained are compared to literature and discussed in this work No attempt was done to determine the critical point exponents near the critical temperature or the study of the elimination of critical slowing down due to above difficulties
