Tropical Nature:

Tropical Nature Adrian Forsyth, Ken Miyata, 2011-05-24 Seventeen marvelous essays introducing the habitats ecology plants and animals of the Central and South American rainforest A lively lucid portrait of the tropics as seen by two uncommonly observant and thoughtful field biologists Its seventeen marvelous essays introduce the habitats ecology plants and animals of the Central and South American rainforest Includes a lengthy appendix of practical advice for the tropical traveler

Tropical Nature and Other Essays Alfred Russel Wallace, It is difficult for an inhabitant of our temperate land to realize either the sudden and violent contrasts of the arctic seasons or the wonderful uniformity of the equatorial climate The lengthening or the shortening days the ever changing tints of spring summer and autumn succeeded by the leafless boughs of winter are constantly recurring phenomena which represent to us the established course of nature At the equator none of these changes occur there is a perpetual equinox and a perpetual summer and were it not for variations in the quantity of rain in the direction and strength of the winds and in the amount of sunshine accompanied by corresponding slight changes in the development of vegetable and animal life the monotony of nature would be extreme In the present chapter it is proposed to describe the chief peculiarities which distinguish the equatorial from the temperate climate and to explain the causes of the difference between them causes which are by no means of so simple a nature as are usually imagined The three great divisions of the earth the tropical the temperate and the frigid zones may be briefly defined as the regions of uniform of variable and of extreme physical conditions respectively They are primarily determined by the circumstance of the earth's axis not being perpendicular to the plane in which it moves round the sun whence it follows that during one half of its revolution the north pole and during the other half the south pole is turned at a considerable angle towards the source of light and heat This inclination of the axis on which the earth rotates is usually defined by the inclination of the equator to the plane of the orbit termed the obliquity of the ecliptic The amount of this obliquity is 23_ degrees and this measures the extent on each side of the equator of what are called the tropics because within these limits the sun becomes vertical at noon twice a year and at the extreme limit once a year while beyond this distance it is never vertical It will be evident however from the nature of the case that the two lines which mark the limits of the geographical tropics will not define any abrupt change of climate or physical conditions such as characterise the tropical and temperate zones in their full development There will be a gradual transition from one to the other and in order to study them separately and contrast their special features we must only take into account the portion of each in which these are most fully exhibited For the temperate zone we may take all countries situated between 35 and 60 of latitude which in Europe will include every place between Christiania and Algiers the districts further south forming a transitional belt in which temperate and tropical features are combined In order to study the special features of tropical nature on the other hand it will be advisable to confine our attention mainly to that portion of the globe which extends for about twelve degrees on each side of the equator in which all the chief tropical phenomena

dependent on astronomical causes are most fully manifested and which we may distinguish as the equatorial zone In the debateable ground between these two well contrasted belts local causes have a preponderating influence and it would not be difficult to point out localities within the temperate zone of our maps which exhibit all the chief characteristics of tropical nature to a greater degree than other localities which are as regards geographical position tropical

Picturing Tropical Nature Nancy Stepan, 2001 *Picturing Tropical Nature* reflects on the work of several nineteenth and twentieth century scientists and artists including Alexander von Humboldt Alfred Russel Wallace Louis Agassiz Sir Patrick Manson and Margaret Mee Their careers illuminate several aspects of tropicalization science and art in the making of tropical pictures the commercial and cultural boom in things tropical in the modern period photographic attempts to represent tropical hybrid races antitropicalism and its role in an emerging environmentalist sensibility and visual depictions of disease in the new tropical medicine Jacket

Colonizing Nature Beth Fowkes Tobin, 2011-06-07 With its control of sugar plantations in the Caribbean and tea cotton and indigo production in India Britain in the eighteenth and nineteenth centuries dominated the global economy of tropical agriculture In *Colonizing Nature* Beth Fowkes Tobin shows how dominion over the tropics as both a region and an idea became central to the way in which Britons imagined their role in the world Tobin examines georgic poetry landscape portraiture natural history writing and botanical prints produced by Britons in the Caribbean the South Pacific and India to uncover how each played a crucial role in developing the belief that the tropics were simultaneously paradisiacal and in need of British intervention and management Her study examines how slave garden portraits denied the horticultural expertise of the slaves how the East India Company hired such artists as William Hodges to paint and thereby Anglicize the landscape and gardens of British controlled India and how writers from Captain James Cook to Sir James E Smith depicted tropical lands and plants Just as mastery of tropical nature and especially its potential for agricultural productivity became key concepts in the formation of British imperial identity *Colonizing Nature* suggests that intellectual and visual mastery of the tropics through the creation of art and literature accompanied material appropriations of land labor and natural resources Tobin convincingly argues that the depictions of tropical plants gardens and landscapes that circulated in the British imagination provide a key to understanding the forces that shaped the British Empire

Picturing Tropical Nature Nancy Stepan, 2001 Whether considered a sublime landscape malignant wilderness or the endangered site of environmental conflicts the tropics are *Picturing Tropical Nature* argues largely a construct of American and European imaginations Nancy Leys Stepan asserts that images of the tropics conveyed through drawings paintings photographs literature and travel writings are central to what Stepan calls the tropicalization of nature or the often harmful misrepresentation of the tropics and its peoples She here examines several aspects of such tropicalization as they emerge through the work of nineteenth and twentieth century scientists and artists including Alexander von Humboldt Alfred Russel Wallace Louis Agassiz Sir Patrick Manson and Margaret Mee From the earliest photographic attempts to represent tropical

hybrid races to depictions of disease in new tropical medicines Picturing Tropical Nature offers new insight into the convergence of the tropics with European and American science and art A brilliant and provocative book the kind of book that carries forward a field in a single stride undoubtedly the finest account of tropicality we have Social History of Medicine
