Statistical Methods and Analyses for Medical Devices Scott A. Pardo, 2023-04-24 This book provides a reference for people working in the design development and manufacturing of medical devices While there are no statistical methods specifically intended for medical devices there are methods that are commonly applied to various problems in the design manufacturing and quality control of medical devices The aim of this book is not to turn everyone working in the medical device industries into mathematical statisticians rather the goal is to provide some help in thinking statistically and knowing where to go to answer some fundamental questions such as justifying a method used to qualify validate equipment or what information is necessary to support the choice of sample sizes While there are no statistical methods specifically designed for analysis of medical device data there are some methods that seem to appear regularly in relation to medical devices For example the assessment of receiver operating characteristic curves is fundamental to development of diagnostic tests and accelerated life testing is often critical for assessing the shelf life of medical device products Another example is sensitivity specificity computations are necessary for in vitro diagnostics and Taguchi methods can be very useful for designing devices Even notions of equivalence and noninferiority have different interpretations in the medical device field compared to pharmacokinetics It contains topics such as dynamic modeling machine learning methods equivalence testing and experimental design for example This book is for those with no statistical experience as well as those with statistical knowledge with the hope to provide some insight into what methods are likely to help provide rationale for choices relating to data gathering and analysis activities for medical devices
