

Thermoanalytical methods

Thermal analysis is the term applied to a group of methods and techniques in which chemical or physical properties of a substance, a mixture of substances or reaction mixture are measured as function of temperature or time, while the substance are subjected to a controlled temperature program.

Thermoanalytical methods in pharmaceutical technology

These methods are useful in:

- ✓ Prediction of drug-excipient compatibility,
- ✓ Studies of solid-dispersion systems,
- ✓ Analysis of enantiomers and racemates,
- ✓ Measurement of the time of tablet disintegration,
- ✓ Analysis of drug formulations and
- ✓ Studies of the processes of grinding and drying of drugs

Thermogravimetric analysis (TGA)

Thermogravimetric analysis or thermal gravimetric analysis is a method of thermal analysis in which the mass of a sample is measured over time as the temperature changes. It is used to determine a material's thermal stability and its fraction of volatile components by monitoring the weight change that occurs as a sample is heated at a constant rate.

Derivative thermogravimetry (DTG)

Derivative thermogravimetry (DTG) is a type of thermal analysis in which the rate of material weight changes upon heating is plotted against temperature and used to simplify reading the weight versus temperature thermogram peaks which occur close together.

Drug-biomembrane interaction studies A. Fortunato,2013-10-31 In DSC the heat flow in and out of a sample and a reference material is measured as a function of temperature as the sample is heated cooled or held isothermally at constant temperature The measurement signal is the energy absorbed or released by the sample in milliwatts DSC can detect endothermic and exothermic effects determine peak areas transition and reaction enthalpies determine temperatures that characterize a peak or other effects and measure specific heat capacity Since the end of the nineteenth century DSC has

been improved and optimized With the numerous technological innovations in both hardware and software it can explore new and demanding applications Different measurement principles sensors signal processing accessories and evaluation capabilities make differential scanning calorimetry one of the most common and versatile techniques in material characterization Today DSC benefits from technological solutions used previously for other applications MEMS technology optical devices and parameter estimation methods

Drug-Biomembrane Interaction Studies Rosario Pignatello,2013-10-31
The design and development of drugs and new pharmaceutical formulations require a full characterization of the chemical and physicochemical events occurring at the level of the single active ingredients or excipients as well as their reciprocal interaction Thermal analysis techniques are among the most widely used methods to achieve this among them the Differential Scanning Calorimetry DSC technique in which the thermotropic behaviour of a single substance or mixtures is analyzed as a function of a controlled temperature program DSC is an accurate and rapid thermo analytical technique widely used by the pharmaceutical industry and in drug research to investigate several physico chemical phenomena such as polymorphism melting and crystallization purity and drug excipient interaction as well as characterizing biomolecules such as genetic material Drug biomembrane interaction studies is written by scientists renowned for their work in the field of DSC applications to drug development and delivery and especially to drug biomembrane interaction studies The book combines insights from biochemistry and physiology with those from structural biology nanotechnology and biothermodynamics to obtain a complete depiction of cell membranes and their functions Summarizes and updates the recent development in a unique handbook format Consists of a combination of scientific updates within the field Contains chapters written by some of the highest level experts in the field of DSC

The Analysis of Thermally Stimulated Processes R. Chen,Y. Kirsh,2013-10-22
Thermally stimulated processes include a number of phenomena either physical or chemical in nature in which a certain property of a substance is measured during controlled heating from a low temperature Workers and graduate students in a wide spectrum of fields require an introduction to methods of extracting information from such measurements This book gives an interdisciplinary approach to various methods which may be applied to analytical chemistry including radiation dosimetry and determination of archaeological and geological ages In addition recent advances are included such as ionic thermocurrent of general order kinetics polarization thermocurrents and some aspects of the superlinear dependence on the dose of thermoluminescence
