Utility of Watershed Models Robert Nunoo,2020 Watershed models are used to represent the physical chemical and biological mechanisms that determine the fate and transport of pollutants in waterbodies Daniel 2011 These models in general are used for exploratory planning and regulatory purposes Harmel and others 2014 Watershed models have numerous applications one such use is the development of total maximum daily load TMDL TMDL is the amount of pollution a waterbody can receive without becoming impaired Because of the challenge of uncertainty associated with models and the TMDL development process the United States Clean Water Act Section 303 d 1 c requires that a margin of safety MOS be specified to account for uncertainty in TMDLs The question of how MOS is estimated in TMDL was identified as a problem by

the National Research Council NRC 2001 Since the identification of the problem about two decades ago there have been very few inventories or audits of approved TMDL studies This study describes a natural language processing and machine learning aided review of the MOS in approved TMDLs from 2002 to 2016 The study determined whether the MOS values incorporated followed a pattern and examined whether there exist a relationship between MOS values and some ecological conditions Relatively few TMDLs were based on some form of calculation to estimate explicit MOS values these TMDLs constituted only 16% of the reviewed sample The remaining 84% used conventional values but few of those studies provided reasons for their selected values A statistical assessment of those MOS values revealed that the MOS depended on States location of waterbody USEPA regions waterbody type designated water use TMDL model used and data availability The findings indicate that few TMDL developers are following the National Research Council's suggestions of using a rigorous uncertainty estimation approach for rational choices for the MOS An adaptive approach based on Bayes Discrepancy was proposed for estimating an MOS for a TMDL The approach is based on the Bayesian hierarchical framework of estimating uncertainty associated with watershed models With this approach TMDL developers can communicate the effects of their watershed model The approach was applied to a Ferson Creek model of the Fox River watershed to assess variability and uncertainty in the model results and also estimate possible MOS values for two monitoring stations in the watershed Results suggest that an MOS of 0.04 mg/L could lead to a 0.1 probability of violating the water quality standard for an underpredicting model The Bayes discrepancy estimation method will enable TMDL developers and watershed managers to strike a balance between implementation options and water quality concerns

Stormwater, Watershed, and Receiving Water Quality Modeling Water Environment Federation, 2020 This publication fills a need for a comprehensive and up to date stormwater quality and modeling manual for the industry It focuses on water quality models models that predict volumes and loads from the land surface both urban and rural and then route the volume and pollutant loading through the receiving waters

Review of Watershed Water Quality Models, 1999 This review was conducted to determine the current state of the art in watershed water quality modeling Several available watershed water quality models were reviewed and rated with regard to their potential in being utilized as the building block for the development of a Corps of Engineers watershed water quality model Watershed water quality models are currently being implemented for predicting watershed runoff water quality as influenced by land use change development watershed improvement strategies best management practices and in the determination of total daily maximum loads The model selected as a building block for the Corps of Engineers model will be implemented into the U S Army Engineer Waterways Experiment Station's Watershed Modeling System WMS The WMS can be used currently in the application of watershed models for both preprocessing and postprocessing Current models contained in the WMS do not have water quality capabilities Thus the implementation of the selected watershed water quality model into the system will extend the capabilities of the system to include watershed water
