Source And Channel Coding An Algorithmic Approach:

Source and Channel Coding John B. Anderson, Seshadri Mohan, 2012-12-06 oW should coded communication be approached Is it about probability theorems and bounds or about algorithms and structures The traditional course in information theory and coding teaches these together in one course in which the Shannon theory a probabilistic theory of information dominates The theory's predictions and bounds to performance are valuable to the coding engineer but coding today is mostly about structures and algorithms and their size speed and error performance While coding has a theoretical basis it has a practical side as well an engineering side in which costs and benefits matter It is safe to say that most of the recent advances in information theory and coding are in the engineering of coding These thoughts motivate the present text book A coded communication book based on methods and algorithms with information theory in a necessary but supporting role There has been much recent progress in coding both in the theory and the practice and these pages report many new advances Chapter 2 covers traditional source coding but also the coding of real one dimensional sources like speech and new techniques like vector quantization Chapter 4 is a unified treatment of trellis codes beginning with binary convolutional codes and passing to the new trellis modulation codes

Kim,1992-12-31 Most queuing analyses performed in the literature are based on characterization of

queueing phenomena in continuous time items Recently in the telecommunication industries BISDN broadband integrated services digital network has received considerable attention since it can provide a common interface for future communication needs including video data and speech Since information in BISDN is transported by means of discrete units of 53 octet ATM asynchronous transfer mode cells interests in discrete time systems have increased Discrete Time Models for Communication Systems Including ATM provides a general framework for queueing analyses of discrete time systems After a brief look at past studies of discrete time systems a detailed description and analysis are presented for a generic discrete time model with a single server arbitrary service times and independent arrivals The book then follows a less stringent approach and focuses more on the average statistics and on different queueing disciplines Conventional first in out and last in first out disciplines are discussed in terms of the average statistics Systems with multiple classes of messages without class dependent priorities are considered to establish a discrete time conservation law Multiple classes with priorities are also considered to derive performance measures of priority scheduling disciplines Finally a multi queue system with cyclic service is analyzed in the context of round robin service ordering This is followed by analyses of discrete time queueing systems with more complicated input and output processes Specifically single server systems are investigated whereby either the arrivals or the server is subject to random interruptions Results are mainly obtained in terms of generating functions and mean values of the principal performance measures The influence of the nature of the arrival correlation and the server interruptions on the queueing behavior is discussed Finally the book explores queueing models directly associated with ATM switches and multiplexers This book is a valuable reference and may be used as a text for an advanced course on the subject
