Vision Of The Brain:

Vision of Brain Semir ZEKI,1993 [A Vision of the Brain](#) Semir Zeki,2010-01-15 Authored by one of the world's foremost authorities on the biology of the brain Illustrated in two colours throughout Contains a section of full colour graphics A benchmark text for students and researchers alike [Vision and Brain](#) James V. Stone,2012-09-21 An engaging introduction to the science of vision that offers a coherent account of vision based on general information processing principles In this accessible and engaging introduction to modern vision science James Stone uses visual illusions to explore how the brain sees the world Understanding vision Stone argues is not simply a question of knowing which neurons respond to particular visual features but also requires a computational theory of vision Stone draws together results from David Marr's computational framework Barlow's efficient coding hypothesis Bayesian inference Shannon's information theory and signal processing to construct a coherent account of vision that explains not only how the brain is fooled by particular visual illusions but also why any biological or computer vision system should also be fooled by these illusions This short text includes chapters on the eye and its evolution how and why visual neurons from different species encode the retinal image in the same way how information theory explains color aftereffects how different visual cues provide depth information how the imperfect visual information received by the eye and brain can be rescued by Bayesian inference how different brain regions process visual information and the bizarre perceptual consequences that result from damage to these brain regions The tutorial style emphasizes key conceptual insights rather than mathematical details making the book accessible to the nonscientist and suitable for undergraduate or postgraduate study **Eye, Brain, and Vision** David H. Hubel,1988 Looks at the physical structure of the eyes optic nerves and brain explains how light is perceived and interpreted and covers color depth and movement [Brain, Vision, Memory](#) Charles G. Gross,1999-07-26 In these engaging tales describing the growth of knowledge about the brain from the early Egyptians and Greeks to the Dark Ages and the Renaissance to the present time Gross attempts to answer the question of how the discipline of neuroscience evolved into its modern incarnation through the twists and turns of history Charles G Gross is an experimental neuroscientist who specializes in brain mechanisms in vision He is also fascinated by the history of his field In these tales describing the growth of knowledge about the brain from the early Egyptians and Greeks to the present time he attempts to answer the question of how the discipline of neuroscience evolved into its modern incarnation through the twists and turns of history The first essay tells the story of the visual cortex from the first written mention of the brain by the Egyptians to the philosophical and physiological studies by the Greeks to the Dark Ages and the Renaissance and finally to the modern work of Hubel and Wiesel The second essay focuses on Leonardo da Vinci's beautiful anatomical work on the brain and the eye was Leonardo drawing the body observed the body remembered the body read about or his own dissections The third essay derives from the question of whether there can be a solely theoretical biology or biologist it highlights the work of Emanuel Swedenborg the eighteenth century Swedish mystic

who was two hundred years ahead of his time The fourth essay entails a mystery how did the largely ignored brain structure called the hippocampus minor come to be and why was it so important in the controversies that swirled about Darwin's theories The final essay describes the discovery of the visual functions of the temporal and parietal lobes The author traces both developments to nineteenth century observations of the effect of temporal and parietal lesions in monkeys observations that were forgotten and subsequently rediscovered

The Visual Brain in Action David Milner, Mel Goodale, 2006-10-12 First published in 1995 this book presents a model for understanding the visual processing underlying perception and action proposing a broad distinction within the brain between two kinds of vision conscious perception and unconscious online vision

Vision and the Brain Bernard Cohen, Ivan Bodis-Wollner, 1990 Experts in neurology ophthalmology neuropsychology physiology and the neurosciences synthesize recent clinical and experimental research The book progresses from primary and oculomotor control and includes studies of visual dysfunction in various neurological and psychiatric disorders With strikingly clear photographs and drawings Annotation copyrighted by Book News Inc Portland OR

We Know It When We See It Richard Masland, 2020-03-10 A Harvard researcher investigates the human eye in this insightful account of what vision reveals about intelligence learning and the greatest mysteries of neuroscience Spotting a face in a crowd is so easy you take it for granted But how you do it is one of science's great mysteries And vision is involved with so much of everything your brain does Explaining how it works reveals more than just how you see In *We Know It When We See It* Harvard neuroscientist Richard Masland tackles vital questions about how the brain processes information how it perceives learns and remembers through a careful study of the inner life of the eye Covering everything from what happens when light hits your retina to the increasingly sophisticated nerve nets that turn that light into knowledge to what a computer algorithm must be able to do before it can be called truly intelligent *We Know It When We See It* is a profound yet approachable investigation into how our bodies make sense of the world

Medical Standard and North American Practitioner, 1917

The Neurology of Vision Jonathan D. Trobe, 2001-03-29 The Neurology of Vision sets out the principles and information needed to understand and manage disorders of the visual pathways in the brain The author divides vision into three components The optical component addresses the eye's ability to properly focus light on the retina The retinocortical component converts light into neural signals in the retina transmitting them to the primary visual cortex Finally the integrative component converts this simple visual information into more complicated forms The symptoms and signs testing methods and diseases of each part of the visual system are presented using this unique structural component approach A final chapter discusses the visual manifestations of psychiatric disturbances The book is heavily illustrated with over 150 beautifully rendered line illustrations 50 radiographic brain images and 60 retinal photographs Case studies with teaching questions are also included to further the reader's knowledge and test understanding
