Visual Space Perception

William J. Benjamin

Visual Space Perception:

Visual Space Perception William H. Ittelson, 1960 *The Perception and Cognition of Visual Space* Paul Linton, 2017-08-28 This book explores a central question in the study of depth perception does the visual system rely upon objective knowledge and subjective meaning to specify visual depth Linton advances an alternative interpretation to the generally accepted affirmative answer according to which many of the apparent contributions of knowledge and meaning to depth perception are better understood as contributions to our post perceptual cognition of depth In order to defend this position a new account of visual cognition is required as well as a better understanding of the optical and physiological cues to depth This book will appeal to students and researchers in psychology vision science and philosophy as well as technologists and content creators working in virtual and augmented reality **Visual Space Perception and Action** Jochen Müsseler, A. H. C. van der Heijden, Dirk Kerzel, 2004 Vision is not an end in itself Instead it has evolved to assure survival in a dynamic environment Vision as well as the other senses evolved from the necessity to act in this environment Therefore perceptual processes and action planning are much more interlocked than evident at first sight This special issue examines the basic processes of space perception and how these processes interact with action planning and motor control The tasks under consideration range from the simple localization of a single object to the coordination of a series of events in natural scenes The contributions were written by various experts in the field ranging from experimental psychologists neurophysiologists to computational modellers and philosophers Each contribution introduces new concepts and ideas that explain how visual space is being established and represented The overarching question is whether vision and action are based on a single spatial map or on different interacting spatial representations **Visual Space Perception** Maurice Hershenson, 1998 *The Geometries of Visual Space* Mark Wagner, 2012-11-12 When most people think of space they think of physical space However visual space concerns space as consciously experienced and it is studied through subjective measures such as asking people to use numbers to estimate perceived distances areas angles or volumes This book explores the mismatch between perception and physical reality and describes the many factors that influence the perception of space including the meaning assigned to geometric concepts like distance the judgment methods used to report the experience the presence or absence of cues to depth and the orientation of a stimulus with respect to point of view The main theme of the text is that no single geometry describes visual space but that the geometry of visual space depends upon the stimulus conditions and mental shifts in the subjective meaning of size and distance In addition *The Geometries of Visual Space* contains philosophical mathematical and psychophysical background material looks at synthetic approaches to space perception including work on hyperbolic spherical and Euclidean geometries presents a meta analysis of studies that ask observers to directly estimate size distance area angle and volume looks at the size constancy literature in which observers are asked to adjust a comparison stimulus to match a variety of standards at different distances away discusses research that

takes a multi dimensional approach toward studying visual space and discusses how spatial experience is influenced by memory While this book is primarily intended for scholars in perception mathematical psychology and psychophysics it will also be accessible to a wider audience since it is written at a readable level It will make a good graduate level textbook on space perception

The Role of Convergence in Visual Space Perception Claes von Hofsten,1974 **Visual Space Perception Through Motion** Gunnar Johansson,1980 **Studies in Auditory and Visual Space Perception** Arthur Henry Pierce,1901 Some Theories of Visual Space August William Weber,1902 *Studies in Auditory and Visual Space Perception* Arthur Henry Pierce, **The Primacy of Depth in Visual Perception** Robert Fox,VANDERBILT UNIV NASHVILLE TN DEPT OF PSYCHOLOGY.,1981 This report is a slightly edited version of an invited address New Fellows Address given by the writer at the national convention of the American Psychological Association in Los Angeles on August 28 1981 The implications of several kinds of recent investigations of three dimensional visual space perception are discussed including investigations performed by the writer and his colleagues and summarized in Contour Interaction in Visual Space The results of all investigations are interpreted as supporting the claim that the X Y Z position of objects in visual space is processed quite early by the visual system This initial identification of the loci of objects in space serves to control subsequent analysis of the characteristics of those objects This interpretation supports a general theory of visual space perception that assumes there is an internal continuous representation of visual space within the visual system This representation is assumed to be an intrinsic hardwired characteristic of that system Conversely support is not given to an alternative general theory of space perception that assumes depth information is processed relatively late in the visual system by an analysis of specific cues to distances cues which acquire their significance gradually by repeated exposure to the environment

The Importance of Optical Motions for Visual Space Perception in Man John Cameron Hay,1961 *Structures of Visual Space Perception in Architecture* Bruce E. Constant,1973 **Virtual and Adaptive Environments** Lawrence J. Hettinger,Michael W. Haas,2003-06-01 With contributions from a collection of authors consisting of many recognizable experts in the field of virtual and adaptive environments as well as many up and coming young researchers this book illustrates the many ways in which psychological science contributes to and benefits from the increased development and application of these nascent systems Discussing issues from both a user and technology based standpoint the volume examines the use of human perception cognition and behavior The book builds a foundation on the assumption that these systems are first and foremost human centered technologies in that their purpose is to complement and extend human capabilities across a wide variety of domains Brain and Behaviour Jules Davidoff,2000 Visual Space Perception and Action: Introductory Remarks Jochen Müsseler,A. H. C. van der Heijden,Dirk Kerzel,2010 *Visual Space Perception* Clarence Henry Graham,1943 *Studies in Auditory and Visual Space Perception* Arthur Henry Pierce,2015-08-09 This work has been selected by scholars as being culturally important and is part of the knowledge base of civilization as we know

The Many Mappings of Visual Space Francesca Cowden Fortenbaugh, 2012 It can be argued that individuals are most often concerned with the objects that exist in an environment as it is these objects that are recognized localized and acted upon However the space between objects plays as critical a role in activities of daily living as the objects themselves because without the perception of an underlying spatial structure accurate localization navigation and manipulations of objects would not be possible To date questions still exist as to how space is perceived across the visual field as a function of eccentricity i e where an object is located within the visual field and the factors that influence space perception in the visual periphery In particular conflicting reports have been found in the literature regarding inherent biases in peripheral localization and the modulating affect of attention on the perceived structure of visual space The aim of these studies was to help resolve some of these issues In the first two chapters it is argued that perception of both the locations and shapes of objects presented in the periphery are influenced by voluntary and involuntary attention In Chapter 2 the results of three experiments demonstrate that changes in the distribution of sustained voluntary attention alter the perceived locations of target dots presented at different eccentricities along the cardinal axes Specifically the results show that when attention is focused on a region of space targets appear to be located more peripherally than when attention is distributed across the visual field The next three experiments in Chapter 3 show that rapid shifts in the location of involuntary attention can distort the perceived shape of an oval These studies support the assertion that changes in attention alter the underlying structure of visual space and thus alter the perceived locations and or shape of any object presented in that space The experiments in Chapter 4 investigate the role of visual boundaries in spatial localization and argue that different classes of borders are associated with the different reference frames and metrics used in defining the underlying perceptual structure of visual space The results of these experiments show that when spatial localization occurs relative to the intrinsic borders of the visual field participants show a peripheral bias and a non linear scaling of target locations across eccentricity The introduction of external boundaries first leads to a linear scaling of target locations and can change the pattern of mislocalization from a peripheral to a foveal bias In Chapter 5 it is argued that the borders of the visual field are used to compute location in a more natural metric percentage of visual

field extent than degrees of visual angle for determining spatial location within a retinotopic reference frame and that this metric may determine the allocation of processing resources across the visual field Using a crowding paradigm in which participants perform significantly better when target gratings are presented along the lower vertical meridian than the upper vertical meridian the results of the final experiment show that both inter subject and intra subject variability can be accounted for by this new metric Collectively these experiments highlight the fact that visual space is not a stable mapping of the external environment Rather the perceived structure of visual space is flexible and can be altered by both the borders that define a space as well as the attentional state of an observer

Changeable Brain Lorin J. Elias, 2026-01-20 Brain injuries can result in highly specific and surprising changes in behaviour that have revealed to us how the mind works The brain is the most complicated object in the known universe After spending millennia trying to understand our ever changing world the brain is now turning its capacities for reasoning remembering and understanding inward as it tries to understand itself The biggest breakthroughs in neuroscience have come mostly by accident These accidents didn't happen in research labs They happened on railway job sites in showers on bicycles in cars or were the result of infections from uncommon diseases When an individual suffers brain damage as the result of an accident or illness the negative effects can be profound life altering and lifelong yet the insights offered by the effects of these injuries have been revolutionary for neuroscientists Through an examination of landmark cases of traumatic brain injury Dr Lorin J Elias explains how each case has expanded our understanding of the mind
