

Figure 4.2: Prediction Model for the Crop Yield

# Weather And Yield

**DP Hallahan**

## **Weather And Yield:**

Weather-based Forecasts of California Crop Yields ,2005 Crop yield forecasts provide useful information to a range of users Yields for several crops in California are currently forecast based on field surveys and farmer interviews while for many crops official forecasts do not exist As broad scale crop yields are largely dependent on weather measurements from existing meteorological stations have the potential to provide a reliable timely and cost effective means to anticipate crop yields We developed weather based models of state wide yields for 12 major California crops wine grapes lettuce almonds strawberries table grapes hay oranges cotton tomatoes walnuts avocados and pistachios and tested their accuracy using cross validation over the 1980 2003 period Many crops were forecast with high accuracy as judged by the percent of yield variation explained by the forecast the number of yields with correctly predicted direction of yield change or the number of yields with correctly predicted extreme yields The most successfully modeled crop was almonds with 81% of yield variance captured by the forecast Predictions for most crops relied on weather measurements well before harvest time allowing for lead times that were longer than existing procedures in many cases
