The Statistical Analysis of Categorical Data Erling B. Andersen, 2012-12-06 The aim of this book is to give an up to date account of the most commonly used statistical models for categorical data The emphasis is on the connection between theory and applications to real data sets The book only covers models for categorical data Various models for mixed continuous and categorical data are thus excluded The book is written as a textbook although many methods and results are quite recent This should imply that the book can be used for a graduate course in categorical data analysis With this aim in mind chapters 3 to 12 are concluded with a set of exercises In many cases the data sets are those data sets which were not included in the examples of the book although they at one point in time were regarded as potential candidates for an example A certain amount of general knowledge of statistical theory is necessary to fully benefit from the book A summary of the basic statistical concepts deemed necessary prerequisites is given in chapter 2 The mathematical level is only moderately high but the account in chapter 3 of basic properties of exponential families and the parametric multinomial distribution is made as mathematically precise as possible without going into mathematical details and leaving out most proofs

Lawson, 2013-07-08 Spatial epidemiology is the description and analysis of the geographical distribution of disease It is more important now than ever with modern threats such as bio terrorism making such analysis even more complex This second

edition of *Statistical Methods in Spatial Epidemiology* is updated and expanded to offer a complete coverage of the analysis and application of spatial statistical methods. The book is divided into two main sections. Part 1 introduces basic definitions and terminology along with map construction and some basic models. This is expanded upon in Part II by applying this knowledge to the fundamental problems within spatial epidemiology such as disease mapping, ecological analysis, disease clustering, bio terrorism, space time analysis, surveillance and infectious disease modelling. Provides a comprehensive overview of the main statistical methods used in spatial epidemiology. Updated to include a new emphasis on bio terrorism and disease surveillance. Emphasizes the importance of space time modelling and outlines the practical application of the method. Discusses the wide range of software available for analyzing spatial data including WinBUGS, SaTScan and R and features an accompanying website hosting related software. Contains numerous data sets each representing a different approach to the analysis and provides an insight into various modelling techniques.
