Topics in Ring Theory Israel Nathan Herstein, 1969 *Topics in Commutative Ring Theory* John J. Watkins, 2009-02-09
Topics in Commutative Ring Theory is a textbook for advanced undergraduate students as well as graduate students and mathematicians seeking an accessible introduction to this fascinating area of abstract algebra. Commutative ring theory arose more than a century ago to address questions in geometry and number theory. A commutative ring is a set such as the integers, complex numbers, or polynomials with real coefficients with two operations, addition and multiplication. Starting from this simple definition, John Watkins guides readers from basic concepts to Noetherian rings, one of the most important classes of commutative rings, and beyond to the frontiers of current research in the field. Each chapter includes problems that encourage active reading, routine exercises, as well as problems that build technical skills and reinforce new concepts. The final chapter is devoted to new computational techniques now available through computers. Careful to avoid intimidating theorems and proofs whenever possible, Watkins emphasizes the historical roots of the subject, like the role of commutative rings in Fermat's last theorem. He leads readers into unexpected territory with discussions on rings of continuous functions and the set-theoretic foundations of mathematics. Written by an award-winning teacher, this is the first introductory textbook to require no prior knowledge of ring theory to get started. Refreshingly informal without ever sacrificing mathematical rigor, Topics in Commutative Ring Theory is an ideal resource for anyone seeking entry into this stimulating field of study.

The book intends to be a collection of research papers on algebra and related topics, most of which were presented at the international Workshop on Associative Rings and Algebras with additional structures WARA22. The purpose of the workshop WARA22 was to present the current state of the art both in the Theory of Lie structures of associative rings and algebras and in the Theory of functional identities in rings. The conference has emerged as a powerful forum offering

researchers the opportunity to meet get to know each other and discuss advances in ring theory inspiring further research directions The main topics covered refer to rings with involution Lie and Jordan structures rings and algebras arising under various constructions modules bimodules and ideals in associative algebras behavior of derivations automorphisms and other kinds of additive maps in rings and algebras All the contributing authors are leading international academicians and researchers in their respective fields The papers cover a wide range of topics in ring theory group theory matrix algebra and graph theory The book will serve both the specialist looking for the latest results and the novice looking for the appropriate references to access the study and understanding of the results presented here
