T Cell Receptor:

The T Cell Receptor FactsBook Marie-Paule Lefranc, Gerard Lefranc, 2001-07-13 The T Cell Receptor FactsBook contains entries on all the 176 functional variable diversity joining and constant regions of the human T cell receptor including alpha beta gamma and delta loci Introductory chapters summarize information of T cell receptor chain synthesis chromosomal location and an overview of the human T cell receptor loci

The T-Cell Receptors Tak W. Mak, 2012-12-06 The importance of thymus dependent cells or T cells in the generation of a successful immune response was first realized in the early sixties In the following two decades a succession of elegant experiments established the antigen specificity of T cells and their ability to perform both as regulatory and effector cells T cells were shown to be essential in most immune reactions playing a crucial role in augmenting the activity of effector T and B cells against foreign antigen as well as in the suppression of effector activity against self antigens The means by which T cells differentiate foreign from self antigens is based on their recognition of antigen almost exclusively in the context of self major histocompatibility complex products unlike B cells which recognize an antigen alone It is this recognition mediated by the T cell receptor that sets into motion the diverse cell cell interactions which control the differentiation and regulation of the immune response Although its importance was well established the molecular nature of the T cell receptor remained elusive for two decades Many hypotheses as to its structure and precise function were put forward using immunoglobulin as a basis for conjecture but the Holy Grail of Immunology remained ephemeral until three years ago In the ensuing years both immunologists and molecular biologists have contributed to an explosion of data unsurpassed by any previous period in the field

T Cell Receptors John I. Bell, Michael J. Owen, M. J. Owen, Dr. Elizabeth Simpson, 1995 T cell receptor genes covers biochemical functional and genetic aspects of this key family of immunological molecules It should be essential reading for all those interested in the TCR and its function in health and disease It deals with the TCR protein its functional interactions with the signal transduction machinery of the T cell and with the structure and organization of the TCR genes It is the only comprehensive volume on the TCR and is written by leaders in the field Particularly useful is the tabulation and nomenclature of all the known TCR alpha and beta variable regions

T Cell Receptor Dynamics Behnam B. Hashemi, 1994

The Role of Gata3 in the Regulation of T Cell Receptor Gene Expression Joseph Edward Marine, 1991

Color Atlas of Immunology Gerd R. Burmester, Antonio Pezzutto, 2003-05-21 Well illustrated and convenient A pocket atlas flexibook on this dynamic and wide ranging field indispensable for students of medicine and biology alike Complex processes are well illustrated in clear images that are not burdened with unnecessary details Following an introductory part and a section on laboratory methods in immunology the bulk of the book concentrates on the manifestations of immunological diseases in the human body providing comprehensive capsule descriptions of all common immune diseases

The Human T-Cell Receptor Repertoire and Transplantation Peter van den Elsen, 2013-06-29 these analyses it became clear that the MHC class I molecule comprised a distinct groove on

the external side of the molecule The sides of the groove are formed by the α helical structures of the α and $\alpha 1 2$ domains and a floor which is formed by 8 anti parallel β strands The various polymorphic residues as determined from DNA sequence analysis are localized within these α helices and β plated sheets within the groove More importantly these analyses also revealed the presence of electron dense material in the groove This material was subsequently identified as a linear peptide of 8-10 amino acids long High resolution crystallographic analyses of the class I MHC structure have revealed the existence of so called pockets within the grooves of the MHC class I molecules These pockets designated A F exhibited allele specificity and are directly involved in the binding of the peptide primarily through interaction with the dominant anchor residues as found in MHC class I associated peptides 6 7 9 11 The class II MHC antigens consist on the cell surface of a 34 kD α chain non covalently associated with a 28 kD β chain With the exception of the DR α chain all other MHC class II α and β chains are polymorphic
