Tree Breeding: Principles and Strategies G. Namkoong, H. C. Kang, J. S. Brouard, 2012-12-06 It has become apparent during discussions with students and colleagues in forest genetics that a universal concern is the achievement of diverse goals of forestry from fiber production in industrial as well as farm forests to conserving forest ecosystems Although we generally have several breeding methods available and several species to breed we seek to satisfy multiple use goals on diverse sites by management techniques that at best can only partially control edaphic environmental variation The dominant approach which was agriculturally motivated has involved intensive effort with complicated breeding plans on single species for uniform adaptability and single product plantations However this is obviously neither the only nor necessarily the best solution for the genetic management of tree species and thus our intent in this volume is to develop ways to achieve multiple objectives in tree breeding We include an array of breeding plans from simple iterated designs to sets of multiple populations capable of using gene actions for different traits in different environments for uncertain futures The presentation is organized around the development of breeding from single to multiple option plans from single to multiple traits from single to multiple environments and from single to multiple populations However it is not a complete How To book and includes neither exercises nor instructions on data handling It also does not include discussion of all modes of reproduction and inheritance encountered in plants
