Structure Of Interconnected Systems H. Nicholson,
Structural Methods in the Study of Complex Systems Elena Zattoni,Anna Maria Perdon,Giuseppe Conte,2019-06-27 Structural Methods in the Study of Complex Systems helps the reader respond to the challenge of mastering complexity in systems and control The book details the fundamental control problems arising from complex dynamical systems and shows how they can be tackled effectively by means of methods developed from graph theory differential algebra and geometric approaches These structural methods produce abstractions that fit a wide variety of applications by taking advantage of their intrinsic focus on the essential characteristics of dynamical systems their geometric perspective and visual representation and their algebraic formalization and ability to generate algorithmic frameworks to complement the theoretical treatment The original work and latest achievements of the contributors expanding on material presented at a workshop organized to coincide with the 2018 European Control Conference will assist systems and control scientists interested in developing theoretical and computational tools to solve analysis and synthesis problems involving complex dynamical systems The contributions provide a comprehensive picture of available results along with a stimulating view of possible directions for future investigations in the field Emphasis is placed on methods with solid computational background and on specific engineering applications so that readers from both theoretical and practical backgrounds will find this collection of use

Lagrangian and Hamiltonian Methods for Nonlinear Control 2003 A Astolfi,Francisco Gordillo,A J Van Der Schaft,2003-10-07 This is the second of a series of IFAC Workshops initiated in 2000 The first one chaired and organized by

Prof. N. Leonard and R. Ortega was held in Princeton in March 2000. This proceedings volume looks at the role played by Lagrangian and Hamiltonian methods in disciplines such as classical mechanics, quantum mechanics, fluid dynamics, electrostatics, celestial mechanics, and how such methods can be practically applied in the control community. Presents and illustrates new approaches to nonlinear control that exploit the Lagrangian and Hamiltonian structure of the system to be controlled. Highlights the important role of Lagrangian and Hamiltonian Structures as design methods. *Advances in Sliding Mode Control* B. Bandyopadhyay, S. Janardhanan, Sarah K. Spurgeon, 2013-03-15. The sliding mode control paradigm has become a mature technique for the design of robust controllers for a wide class of systems including nonlinear uncertain and time delayed systems. This book is a collection of plenary and invited talks delivered at the 12th IEEE International Workshop on Variable Structure System held at the Indian Institute of Technology Mumbai, India, in January 2012. After the workshop, these researchers were invited to develop book chapters for this edited collection in order to reflect the latest results and open research questions in the area. The contributed chapters have been organized by the editors to reflect the various themes of sliding mode control, which are the current areas of theoretical research and applications, focus, namely: articulation of the fundamental underpinning theory of the sliding mode design paradigm; sliding modes for decentralized system representations; control of time delay systems; the higher order sliding mode concept; results applicable to nonlinear and underactuated systems; sliding mode observers; discrete sliding mode control; together with cutting edge research contributions in the application of the sliding mode concept to real world problems. This book provides the reader with a clear and complete picture of the current trends in Variable Structure Systems and Sliding Mode Control Theory. **Event-based state-feedback control of physically interconnected systems** Christian Stöcker, 2014. Event based control is a means to restrict the feedback in control loops to event time instants that are determined by a well defined triggering mechanism. The aim of this control strategy is to adapt the communication over the feedback link to the system behavior. In this thesis, a state feedback approach to event based control is extended to systems that are composed of physically interconnected subsystems. The main concern of this thesis is disturbance rejection in interconnected systems, which is supposed to be best accomplished by a continuous state feedback. This consideration leads to the idea that the event based state feedback system should approximate the disturbance rejection behavior of a continuous state feedback system with adjustable precision. Various methods for the event based control of physically interconnected systems are investigated. In particular, decentralized, distributed, and centralized state feedback is studied, which differ with respect to the effort for the communication between the components of the event based controller over the communication network. The main results concern the design and analysis of event based state feedback control methods for physically interconnected systems. For all approaches, the disturbance behavior of a continuous state feedback system is shown to be approximated with adjustable accuracy by the event based state feedback system. The novel event based control methods are tested and evaluated in experiments on a
