Yield Curve Modeling and Forecasting Francis X. Diebold, Glenn D. Rudebusch, 2013-01-15 Understanding the dynamic evolution of the yield curve is critical to many financial tasks including pricing financial assets and their derivatives managing financial risk allocating portfolios structuring fiscal debt conducting monetary policy and valuing capital goods Unfortunately most yield curve

models tend to be theoretically rigorous but empirically disappointing or empirically successful but theoretically lacking In this book Francis Diebold and Glenn Rudebusch propose two extensions of the classic yield curve model of Nelson and Siegel that are both theoretically rigorous and empirically successful The first extension is the dynamic Nelson Siegel model DNS while the second takes this dynamic version and makes it arbitrage free AFNS Diebold and Rudebusch show how these two models are just slightly different implementations of a single unified approach to dynamic yield curve modeling and forecasting They emphasize both descriptive and efficient markets aspects they pay special attention to the links between the yield curve and macroeconomic fundamentals and they show why DNS and AFNS are likely to remain of lasting appeal even as alternative arbitrage free models are developed Based on the Econometric and Tinbergen Institutes Lectures Yield Curve Modeling and Forecasting contains essential tools with enhanced utility for academics central banks governments and industry

Yield Curve Modelling and a Conceptual Framework for Estimating Yield Curves, 2018 The European Central Bank ECB as part of its forward looking strategy needs high quality financial market statistical indicators as a means to facilitate evidence based and sound decision making Such indicators include timely market intelligence and information to gauge investors expectations and reaction functions with regard to policy decisions The main use of yield curve estimations from an ECB monetary policy perspective is to obtain a proper empirical representation of the term structure of interest rates for the euro area which can be interpreted in terms of market expectations of monetary policy economic activity and inflation expectations over short medium and long term horizons Yield curves therefore play a pivotal role in the monitoring of the term structure of interest rates in the euro area In this context the purpose of this paper is twofold firstly to pave the way for a conceptual framework with recommendations for selecting a high quality government bond sample for yield curve estimations where changes mainly reflect changes in the yields to maturity rather than in other attributes of the underlying debt securities and models and secondly to supplement the comprehensive mainly theoretical literature with the more empirical side of term structure estimations by applying statistical tests to select and produce representative yield curves for policymakers and market makers

Modelling the Yield Curve Mr. Mark P. Taylor, 1991-12-01 We test and estimate a variety of alternative models of the yield curve using weekly high

quality U K data We extend the Campbell Shiller technique to the overlapping data case and apply it to reject the pure expectations hypothesis under rational expectations We also find that risk measures in the form of conditional interest rate volatility are unable to explain the term premium A simple market segmentation approach is however moderately successful in explaining the term premium

The Forecasting Accuracy of Models of the Term Structure of Interest Rates Alan David Kraus,1969

Parsimoneous Modeling of Yield Curves for U.S. Treasury Bills Charles R. Nelson,1985 A new model is proposed for representing the term to maturity structure of interest rates at a point in time The model produces humped monotonic and S shaped yield curves using four parameters Conditional on a time decay parameter estimates of the other three are obtained by least squares Yield curves for thirty seven sets of U S Treasury bill yields with maturities up to one year are presented The median standard deviation of fit is just over seven basis points and the corresponding median R squared is 96 Study of residuals suggests the existence of specific maturity effects not previously identified Using the models to predict the price of a long term bond provides a diagnostic check and suggests directions for further research
