Ada Software Tools Interfaces Peter J. L. Wallis,1984-11 **Handbook of Graph Grammars and Computing by Graph Transformation** Hartmut Ehrig,1997 Graph grammars originated in the late 60s motivated by considerations about pattern recognition and compiler construction Since then the list of areas which have interacted with the development of graph grammars has grown quite impressively Besides the aforementioned areas it includes software specification and development VLSI layout schemes database design modeling of concurrent systems massively parallel computer architectures logic programming computer animation developmental biology music composition visual languages and many others The area of graph grammars and graph transformations generalizes formal language theory based on strings and the theory of term rewriting based on trees As a matter of fact within the area of graph grammars graph transformation is considered a fundamental computation paradigm where computation includes specification programming and implementation Over the last three decades graph grammars have developed at a steady pace into a theoretically attractive and important for applications research field Volume 2 of the indispensable Handbook of Graph Grammars and Computing by Graph Transformations considers applications to functional languages visual and object oriented languages software engineering mechanical engineering chemical process engineering and images It also presents implemented specification languages and tools and structuring and modularization concepts for specification languages The contributions have been written in a tutorial survey style by the top experts in the corresponding areas This volume is accompanied by a CD Rom containing implementations of specification environments based on graphtransformation systems and tools whose implementation is based on the use of graph transformation systems **Fundamental Approaches to Software**

Graph Transformation for Software Engineers Reiko Heckel, Gabriele Taentzer, 2020-05-13 This book is an introduction to graph transformation as a foundation to model based software engineering at the level of both individual systems and domain specific modelling languages The first part of the book presents the fundamentals in a precise yet largely informal way Besides serving as prerequisite for describing the applications in the second part it also provides a comprehensive and systematic survey of the concepts notations and techniques of graph transformation The second part presents and discusses a range of applications to both model based software engineering and domain specific language engineering The variety of these applications demonstrates how broadly graphs and graph transformations can be used to model analyse and implement complex software systems and languages This is the first textbook that explains the most commonly used concepts notations techniques and applications of graph transformation without focusing on one particular mathematical representation or implementation approach Emphasising the research and engineering methodologies used it will be a valuable resource for graduate students practitioners and researchers in software engineering foundations of programming and formal methods

Presentation by Tree Transformation Vance Maverick, 1997 Abstract Every interactive system requires a presentation mechanism to show the user the data it handles Often the relationship between the data and its presentation is complex further it is often mediated by a style mechanism allowing the user or a designer to describe how the data should be displayed It is a standing engineering challenge to develop a presentation model that is flexible handling many kinds of data and layout powerful giving the user extensive control over appearance and efficient enough for interactive work In this dissertation we propose a model of presentation by tree transformation Because information often has a hierarchical logical structure trees are widely used to represent documents and other data The layout or presentation of a document is also often modeled as a computation over a tree But these trees are not generally identical In other words presentation can be seen as a mapping between trees Casting it as a formal tree transformation offers both expressive compact style specifications and efficient implementation We present a general framework for presentation by tree transformation It has been implemented as part of Ensemble a

software development environment and multimedia document system developed in our research group at Berkeley We describe the tree transformation mechanism and a language for specifying presentation styles as transformations In addition we have developed several distinct output tree languages or media a pretty printer for formatting programs a graphing tool for presenting numerical data as x y plots and a general tree viewer for displaying the structure of any document We define four measures of efficiency that are important for interactive presentation These are startup time the time taken to bring up a document the first time refresh time the time to redraw a document change time the time to process a simple change such as a character insertion and the size of presentation data in memory We show that the implementation can be tuned to provide good performance according to each measure
