Statistical Shape Analysis for Bio-structures Daniel Alejandro Valdés Amaro,2009

Statistical Shape Analysis of Anatomical Structures Poilna Golland,2001

Cont For morphological studies the discriminative direction can be conveniently represented by a deformation of the original shape yielding an intuitive description of shape differences for visualization and further analysis Based on this approach we present a system for statistical shape analysis using distance transforms for shape representation and the Support Vector Machines learning algorithm for the optimal classifier estimation We demonstrate it on artificially generated data sets as well as real medical studies

Permutation Tests in Shape Analysis LUIGI SALMASO,Chiara Brombin,2013-09-06

Statistical shape analysis is a geometrical analysis from a set of shapes in which statistics are measured to describe geometrical properties from similar shapes or different groups for instance the difference between male and female Gorilla skull shapes normal and pathological bone shapes etc Some of the important aspects of shape analysis are to obtain a measure of distance between shapes to estimate average shapes from a possibly random sample and to estimate shape variability in a sample

1 One of the main methods used is principal component analysis Specific applications of shape analysis may be found in archaeology architecture biology geography geology agriculture genetics medical imaging security applications such as face recognition entertainment industry movies games computer aided design and manufacturing This is a proposal for a new Brief on statistical shape analysis and the various new parametric and non parametric methods utilized to facilitate shape analysis

The Statistical Theory of Shape Christopher G. Small,2012-12-06

In general terms the shape of an object data set or image can be de fined as the total of all information that is invariant under translations rotations and isotropic rescalings Thus two objects can be said to have the same shape if they are similar in the sense of Euclidean geometry For example all equilateral triangles have the same shape and so do all cubes In applications bodies rarely have exactly the same shape within measure ment error In such cases the variation in shape can often be the subject of statistical analysis The last decade has seen a considerable growth in interest in the statis tical theory of shape This has been the result of a synthesis of a number of different areas and a recognition that there is considerable common ground among these areas in their study of shape variation Despite this synthesis of disciplines there are several different schools of statistical shape analysis One of these the Kendall school of shape analysis uses a variety of mathe matical tools from differential geometry and probability and is the subject of this book The book does not assume a particularly strong background by the reader in these subjects and so a brief introduction is provided to each of these topics Anyone who is unfamiliar with this material is advised to

consult a more complete reference As the literature on these subjects is vast the introductory sections can be used as a brief guide to the literature

Statistical Shape Analysis for Bilateral Symmetry Kolamunnage Dona Rasanga Ruwanthi,2005 *Parametric and Nonparametric Inference for Statistical Dynamic Shape Analysis with Applications* Chiara Brombin,Luigi Salmaso,Lara Fontanella,Luigi Ippoliti,Caterina Fusilli,2016-02-11 This book considers specific inferential issues arising from the analysis of dynamic shapes with the attempt to solve the problems at hand using probability models and nonparametric tests The models are simple to understand and interpret and provide a useful tool to describe the global dynamics of the landmark configurations However because of the non Euclidean nature of shape spaces distributions in shape spaces are not straightforward to obtain The book explores the use of the Gaussian distribution in the configuration space with similarity transformations integrated out Specifically it works with the offset normal shape distribution as a probability model for statistical inference on a sample of a temporal sequence of landmark configurations This enables inference for Gaussian processes from configurations onto the shape space The book is divided in two parts with the first three chapters covering material on the offset normal shape distribution and the remaining chapters covering the theory of NonParametric Combination NPC tests The chapters offer a collection of applications which are bound together by the theme of this book They refer to the analysis of data from the FG NET Face and Gesture Recognition Research Network database with facial expressions For these data it may be desirable to provide a description of the dynamics of the expressions or testing whether there is a difference between the dynamics of two facial expressions or testing which of the landmarks are more informative in explaining the pattern of an expression

Nonrigid Shape Correspondence for Statistical Shape Analysis Theodor Dan Richardson,2006 **Methods of Multivariate Statistical Analysis and Their Applications** Czesław Domański,Dorota Pekasiewicz,2007 Statistical Shape Modeling for Custom Design and Analysis Xilu Wang,2017 The goal of this dissertation research is to use pre existing shape data to improve efficiency and quality of custom design and analysis The rapid advancement of sensor miniaturization and growing sensor networks and computer power has lead to wide availability of massive shape data from populations of objects Such massive shape data range from human body shapes to longitudinal knee observations of osteoarthritis patients Populations of shape data also include shapes of man made objects such as part shapes of the same model due to manufacturing process variation as well as part shapes due to shape degradation after deployment Mining and analysis of such massive population based shape data can result in knowledge of shape variability of the population and lead to the construction of faithful subject specific 3D shape models from sparse measurements It is then possible to predict shape specific functional performance and population wide structural performance variation Such an ability brings about unprecedented capabilities and tantalizing opportunities for mass customization part specific failure

prediction and just in time part maintenance and patient specific biomedical intervention and treatment This work aims at developing efficient approaches that can 1 construct faithful subject specific shape models from sparse measurements 2 predict shape specific structural performance from a given subject specific shape model and 3 predict structural performance variation over a shape population Toward this end we present a statistical atlas based approach that incorporates statistical shape modeling in subject specific shape reconstruction finite element FE modeling and analysis The statistical atlas contains three parts the mean shape and the variation modes of the shape population which span a linear shape space the FE mesh of the mean shape and the selected feature points and sizing dimensions The feature points and sizing dimensions are selected by maximizing the total variance they capture of the shape population Given a subject e g a person the corresponding dimensions are measured and the subject specific shape model is synthesized The FE mesh of the mean shape serves as the template mesh which can be morphed to the subject shape to conduct subject specific FE analysis The FE solution on the template mesh can also be extrapolated to the subject shape through Taylor expansion The shape variances along the variation modes are obtained by the principal component analysis These variances tell the amount of shape variabilities in the population and are combined with the Taylor expansion of the FE solution to obtain the structural performance variation across the population The numerical testings with various 2D and 3D shape databases demonstrate the efficiency and effectiveness of the proposed approach for custom design and analysis In this dissertation a statistical atlas based framework is developed for custom design and analysis The main contributions of this work are 1 An approach that selects feature points and sizing dimensions based on the total variance captured of the shape population 2 Automated subject specific FE modeling through mesh morphing based on the shape correspondence obtained by searching in the shape space A multi correlation based metric is developed to evaluate the quality of the obtained shape correspondences 3 A Taylor expansion approach for predicting subject specific structural performance and computing structural performance variation over a shape population Multi point Taylor expansion approach is developed for the cases that the structural performance is highly nonlinear with respect to the shape parameters

Statistics and Analysis of Shapes Hamid Krim,Anthony Yezzi,2007-12-31 The subject of pattern analysis and recognition pervades many aspects of our daily lives including user authentication in banking object retrieval from databases in the consumer sector and the omnipresent surveillance and security measures around sensitive areas Shape analysis a fundamental building block in many approaches to these applications is also used in statistics biomedical applications Magnetic Resonance Imaging and many other related disciplines With contributions from some of the leading experts and pioneers in the field this self contained unified volume is the first comprehensive treatment of theory methods and algorithms available in a single resource Developments are discussed from a rapidly increasing number of research papers in diverse fields including the mathematical and physical sciences engineering and medicine
