VLSI Design Methodologies for Digital Signal Processing Architectures Magdy Bayoumi, 1994-01-31 Designing VLSI systems represents a challenging task It is a transposition among different specifications corresponding to different levels of design abstraction behavioral structural and physical The behavioral level describes the functionality of the design It consists of two components static and dynamic The static component describes operations whereas the dynamic component describes sequencing and timing The

structural level contains information about components control and connectivity The physical level describes the constraints that should be imposed on the floor plan the placement of components and the geometry of the design Constraints of area speed and power are also applied at this level To implement such multilevel transformation a design methodology should be devised taking into consideration the constraints limitations and properties of each level The mapping process between any of these domains is non isomorphic A single behavioral component may be transformed into more than one structural component Design methodologies are the most recent evolution in the design automation era which started off with the introduction and subsequent usage of module generation especially for regular structures such as PLA s and memories A design methodology should offer an integrated design system rather than a set of separate unrelated routines and tools A general outline of a desired integrated design system is as follows Decide on a certain unified framework for all design levels Derive a design method based on this framework Create a design environment to implement this design method

Y. Kung,UNIVERSITY OF SOUTHERN CALIFORNIA LOS ANGELES DEPT OF ELECTRICAL ENGINEERING.,1983 Driven by steep increase in the complexity of computations processing speed requirements and the volume of data handled in various signal processing applications modern signal processing research and development is undergoing a major revolution On the other hand the availability of low cost high density fast speed VLSI devices has timely opened a new avenue for implementing these increasingly sophisticated algorithms and systems Therefore the future trend of VLSI signal processing research will require very close interactions between different disciplines in VLSI computer engineering and signal processing This paper addresses three fundamental issues 1 impact of VLSI on signal processing methods 2 impact of VLSI on array processors for signal processing 3 integrated design of signal processing systems The purpose is to provide a cross disciplinary understanding of the modern signal processing techniques parallel array processors and VLSI technology potentials and constraints Author Digital Signal Processing Functions for Vlsi

Asynchronous Circuit Design for VLSI Signal Processing Teresa H. Meng, Sharad Malik, 2011-06-27 Asynchronous Circuit
Design for VLSI Signal Processing is a collection of research papers on recent advances in the area of specification design
and analysis of asynchronous circuits and systems This interest in designing digital computing systems without a global clock
is prompted by the ever growing difficulty in adopting global synchronization as the only efficient means to system timing
Asynchronous circuits and systems have long held interest for circuit designers and researchers alike because of the inherent
challenge involved in designing these circuits as well as developing design techniques for them The frontier research in this
area can be traced back to Huffman's publications The Synthesis of Sequential Switching Circuits in 1954 followed by Unger's
book Asynchronous Sequential Switching Circuits in 1969 where a theoretical foundation for handling logic hazards was
established In the last few years a growing number of researchers have joined force in unveiling the mystery of designing
correct asynchronous circuits and better yet have produced several alternatives in automatic synthesis and verification of
such circuits This collection of research papers represents a balanced view of current research efforts in the design synthesis
and verification of asynchronous systems
