commercially successful GeoTapTM real time LWD MWD method for formation testing and also a parallel method used by China Oilfield Services which enabled the use of data taken at early times in low mobility and large flowline volume environments to support the important estimation of mobility compressibility and pore pressure which are necessary for flow economics and fluid contact boundaries analyses This work was later extended through two Department of Energy Small Business Innovation Research awards While extremely significant the effect of high pressures in the borehole could not be fully accounted for The formation tester measures a combination of reservoir and mud pressure and cannot ascertain how much is attributed to unimportant borehole effects The usual approach is simply wait until the effects dissipate which may require hours which imply high drilling and logging costs plus increased risks in safety and tool loss The author has now modeled this supercharge effect and developed a powerful mathematical algorithm that fully accounts for mud interations In short accurate predictions for mobility compressibility and pore pressure can now be undertaken immediately after an interval is drilled without waiting This groundbreaking new work is a must have for any petroleum reservoir or mud engineer working in the industry solving day to day problems that he or she encounters in the field
