Carbon Footprint Checklist:

Carbon Footprints as Cultural-Ecological Metaphors Anita Girvan, 2017-10-10 Through an examination of carbon footprint metaphors this book demonstrates the ways in which climate change and other ecological issues are culturally and materially constituted through metaphor. The carbon footprint metaphor has achieved a ubiquitous presence in Anglo North American public contexts since the turn of the millennium yet this metaphor remains under examined as a crucial mediator of political responses to the urgent crisis of climate change. Existing books and articles on the carbon footprint typically treat this metaphor as a quantifying metric with little attention to the shifting mediations and practices of the carbon footprint as a metaphor. This gap echoes a wider gap in understanding metaphors as key figures in mediating more than human relations at a time when such relations profoundly matter. As a timely intervention this book addresses this gap by using insights from environmental humanities and political ecology to discuss carbon footprint metaphors in popular and public texts. This book will be of great interest to researchers and students of environmental humanities, political ecology, environmental communication and metaphor studies.

freed when fossil fuels are burned In this process carbon dioxide is produced and rises into the atmosphere where it is causing global warming due to reflection of infrared As a counter measure with the aim to reduce the GHGs the Kyoto Protocol was signed on 11th of December 1997 In this regards many policy mechanisms to reduce GHG emissions are discussed and are already exists Scholars are predicting that the mechanism with the strongest effect is pricing on carbon This assignment is explaining briefly the background of carbon dioxide and provides also a short introduction of the carbon footprint of products and enterprises The main part of the work deals with economical aspects of carbon taxation The chapter is analyzing the greenhouse emission trends since 1990 and derives the affected industry sectors for carbon taxation Further the cost of carbon taxation in the EEC is evaluated and an estimated cost increase for a 4 person household in the European member states given The finding of this assignment is that carbon taxation in the EEC is useful and is raising the motivation to develop engines that are more efficient and in addition encourage alternative energy sources At the same time there are also risks involved in carbon taxation if this is only a European decision rather than a global strategy In that case future investments are potentially done outside the EEC due to lower or even no taxation on carbon emission **Climate Change**
