Welding to pursue all available means to improve the levels of productivity and safety across the underwater welding
industry One approach which has become a priority of the committee is the inclusion of Human and Organizational Factors
considerations within the Specifications in the form of an HOF supplementary annex This paper provides a brief summation
of HOF principles a methodology for developing an HOF Annex for underwater welding recommended content and structure

contains the proceedings of the International Conference held at Trondheim Norway on June 27 28 1983 under the auspices
of the International Institute of Welding The book separates the papers of the conference into Portevin Lecture General
Survey and another four sections The Portevin Lecture part explains welding under water and in the splash zone while the
General Survey part talks about the technologies practices and metallurgy of underwater welding The four sections detail the

Thompson, 1969 The Effect of Water Temperature on Underbead Cracking of Underwater Wet Weldments Robert L. Johnson, 1997-09-01 Specifications for Underwater Welding have not yet addressed the effect of water temperature on weldment microstructure The environmental effects on Underwater Wet Welding using a shielded metal arc welding SMAW process are severe with higher quenching rates porosity slag inclusions and diffusible hydrogen levels One of the problems associated with these high quenching rates and high diffusible hydrogen levels is the increased likelihood of underbead cracking in the heat affected zone HAZ particularly with steel weldment which have a higher carbon equivalent approximately greater than 0.3 In this work the underbead cracking resulting in three underwater test welds made on ASTM 516 grade 70 steel three different water temperatures 2.8 deg C 10 deg C and 31 deg C was investigated This was done by optical and scanning electron microscopy SEM and by making microhardness measurements HAZ underbead cracking was observed in all three weldments but was much less prevalent in the 31 deg C sample and could only be seen at high magnifications in the optical microscope The cracking in this weldment only appeared to occur in isolated regions where head tempering had been ineffective for some reason The weldments made at 10 deg C and 2.8 deg C both showed extensive evidence of underbead HAZ cracking typical of that associated with rapid cooling rates high diffusible hydrogen levels and hard microstructures SEM studies of the surfaces of these cracks showed evidence for transgranular failure with secondary cracking both of which are typical of hydrogen induced cracking This work highlights the importance of water temperature quenching and diffusible hydrogen levels in underwater wet welding This is an issue of critical importance in the future wet welding structural repair of Naval ships
