Robust Automatic Speech Recognition Jinyu Li,Li Deng,Reinhold Haeb-Umbach,Yifan Gong,2015-10-30 Robust Automatic Speech Recognition A Bridge to Practical Applications establishes a solid foundation for automatic speech recognition that is robust against acoustic environmental distortion It provides a thorough overview of classical and modern noise and reverberation robust techniques that have been developed over the past thirty years with an emphasis on practical methods that have been proven to be successful and which are likely to be further developed for future applications The strengths and weaknesses of robustness enhancing speech recognition techniques are carefully analyzed The book covers noise robust techniques designed for acoustic models which are based on both Gaussian mixture models and deep neural networks In addition a guide to selecting the best methods for practical applications is provided The reader will Gain a unified deep and systematic understanding of the state of the art technologies for robust speech recognition Learn the links and relationship between alternative technologies for robust speech recognition Be able to use the technology analysis and categorization detailed in the book to guide future technology development Be able to develop new noise robust methods in the current era of deep learning for acoustic modeling in speech recognition The first book that provides a comprehensive review on noise and reverberation robust speech recognition methods in the era of deep neural networks Connects robust speech recognition techniques to machine learning paradigms with rigorous mathematical treatment Provides elegant and structural ways to categorize and analyze noise robust speech recognition techniques Written by leading researchers who have been actively working on the subject matter in both industrial and academic organizations for many years **The Voice in the Machine** Roberto Pieraccini,2012 An examination of more than sixty years of successes and failures in developing technologies that allow computers to understand human spoken language Stanley Kubrick s 1968 film 2001 A Space Odyssey famously featured HAL a computer with the ability to hold lengthy conversations with his fellow space travelers More than forty years later we have advanced computer technology that Kubrick never imagined but we do not have computers that talk and understand speech as HAL did Is it a failure of our technology that we have not gotten much further than an automated voice that tells us to say or press 1 Or is there something fundamental in human language and speech that we do not yet understand deeply enough to be able to replicate in a computer In The Voice in the Machine Roberto Pieraccini examines six decades of work in science and technology to develop computers that can interact with humans using speech and the industry that has arisen around the quest for these technologies He shows that although the computers today that understand speech may not have HAL s capacity for conversation they have capabilities that make them usable in many applications today and are on a fast track of improvement and innovation Pieraccini describes the evolution of speech recognition and speech understanding processes from waveform methods to artificial intelligence approaches to statistical learning and modeling of human speech based on a rigorous mathematical model specifically Hidden Markov Models HMM

He details the development of dialog systems the ability to produce speech and the process of bringing talking machines to the market Finally he asks a question that only the future can answer will we end up with HAL like computers or something completely unexpected **Speech Recognition by Machine** William Anthony Ainsworth,1988 *Speech Recognition by Machine* Renato Adrian Frizzo,1979 **Automatic Speech and Speaker Recognition** Joseph Keshet,Samy Bengio,2009-04-27 This book discusses large margin and kernel methods for speech and speaker recognition Speech and Speaker Recognition Large Margin and Kernel Methods is a collation of research in the recent advances in large margin and kernel methods as applied to the field of speech and speaker recognition It presents theoretical and practical foundations of these methods from support vector machines to large margin methods for structured learning It also provides examples of large margin based acoustic modelling for continuous speech recognizers where the grounds for practical large margin sequence learning are set Large margin methods for discriminative language modelling and text independent speaker verification are also addressed in this book Key Features Provides an up to date snapshot of the current state of research in this field Covers important aspects of extending the binary support vector machine to speech and speaker recognition applications Discusses large margin and kernel method algorithms for sequence prediction required for acoustic modeling Reviews past and present work on discriminative training of language models and describes different large margin algorithms for the application of part of speech tagging Surveys recent work on the use of kernel approaches to text independent speaker verification and introduces the main concepts and algorithms Surveys recent work on kernel approaches to learning a similarity matrix from data This book will be of interest to researchers practitioners engineers and scientists in speech processing and machine learning fields **Speech Recognition by Machine** Victoria University of Wellington. Department of Computer Science,A. Kingston,1992 **Speech Recognition by Man and MacHine** Bernd T. Meyer,2010-11 While human listeners have little problems in dealing with the strong variation in spoken language the same cannot be said about automatic speech recognition ASR This work compares recognition performance of man and machine with the aim of learning from the distinct errors between these two Based on the differences the signal processing mechanisms are analyzed that are suitable to increase the robustness of ASR The comparison focuses on the influence of intrinsic variation of speech i e changes in speaking rate effort and style as well as dialect and accent The outcome of the experiments suggests that the processing of temporal cues in ASR bears room for improvement Therefore spectro temporal features are employed as input to ASR systems which results in an increase of recognition performance for varying speaking effort and speaking style compared to standard features This documents the usefulness of spectro temporal and temporal information for automatic recognizers **Voice Communication Between Humans and Machines** for the National Academy of Sciences,1994-02-01 Science fiction has long been populated with conversational computers and robots Now speech synthesis and recognition have matured to where a wide range of real world applications from serving people with

disabilities to boosting the nation s competitiveness are within our grasp Voice Communication Between Humans and Machines takes the first interdisciplinary look at what we know about voice processing where our technologies stand and what the future may hold for this fascinating field The volume integrates theoretical technical and practical views from world class experts at leading research centers around the world reporting on the scientific bases behind human machine voice communication the state of the art in computerization and progress in user friendliness It offers an up to date treatment of technological progress in key areas speech synthesis speech recognition and natural language understanding The book also explores the emergence of the voice processing industry and specific opportunities in telecommunications and other businesses in military and government operations and in assistance for the disabled It outlines as well practical issues and research questions that must be resolved if machines are to become fellow problem solvers along with humans Voice Communication Between Humans and Machines provides a comprehensive understanding of the field of voice processing for engineers researchers and business executives as well as speech and hearing specialists advocates for people with disabilities faculty and students and interested individuals   *Speech Recognition by Machine [microform]* Bryden, Brian Richard,1970   **Speechreading by Humans and Machines** David G. to extract useful information from it processing includes the implementation of electric signals on the acoustic pressure waves collected from human vocalization and applying mathematical analysis to it The field of processing speech involves the natural operation of analysing speech coding augmentation synthesis and recognition Analysis of speech is the study of its creation mechanism to make a mathematical model of physical phenomena Speech coding aims to keep information about specific speech parameters for later retrieval The method of refining precision and quality of speech which is noisy utilises various algorithms is recognized as speech enhancement 2 Producing artificial human speech using coded information is known as the synthesis of speech The method of inverse synthesis is the capability of a program or machine to classify the linguistic contents mixed up in the speech signal
