Geometric Nonlinear Functional Analysis Yoav Benyamini, Joram Lindenstrauss, 1998 This book presents a systematic and unified study of geometric nonlinear functional analysis This area has its classical roots in the beginning of the twentieth century and is now a very active research area having close connections to geometric measure theory probability classical analysis combinatorics and Banach space theory The main theme of the book is the study of uniformly continuous and Lipschitz functions between Banach spaces e g differentiability stability approximation existence of extensions fixed points etc This study leads naturally also to the classification of Banach spaces and of their important subsets mainly spheres in the uniform and Lipschitz categories Many recent rather deep theorems and delicate examples are included with complete and detailed proofs Challenging open problems are described and explained and promising new research directions are indicated

Geometric Properties of Banach Spaces and Nonlinear Iterations Charles Chidume, 2008-12-21 The contents of this monograph fall within the general area of nonlinear functional analysis and applications We focus on an important topic within this area geometric properties of Banach spaces and nonlinear iterations a topic of intensive research efforts especially within the past 30 years or so In this theory some geometric properties of Banach spaces play a crucial role In the first part of the monograph we expose these geometric properties most of which are well known As is well known among all infinite dimensional Banach spaces Hilbert spaces have the nicest geometric properties The availability of the inner product the fact that the proximity map or nearest point map of a real Hilbert space H onto a closed convex subset K of H is Lipschitzian with constant 1 and the following two identities $\|x - y\| \leq \|x - z\| + \|z - y\|$ and $\|x - y\| \leq \|x - z\| + \|z - y\|$ which hold for all $x, y \in H$ are some of the geometric properties that characterize inner product spaces and also make certain problems posed in Hilbert spaces more manageable than those in general Banach spaces However as has been rightly observed by M Hazewinkel many and probably most mathematical objects and models do not naturally live in Hilbert spaces Consequently to extend some of the Hilbert space techniques to more general Banach spaces analogues of the identities and have
