Nicolaescu, 1996 The object of this book is to introduce the reader to some of the most important techniques of modern global geometry In writing it we had in mind the beginning graduate student willing to specialize in this very challenging field of mathematics The necessary prerequisite is a good knowledge of the calculus with several variables linear algebra and some elementary point set topology We tried to address several issues 1 The Language 2 The Problems 3 The Methods 4 The Answers Historically the problems came first then came the methods and the language while the answers came last The space constraints forced us to change this order and we had to painfully restrict our selection of topics to be covered This process always involves a loss of intuition and we tried to balance this by offering as many examples and pictures as often as possible We test most of our results and techniques on two basic classes examples surfaces which can be easily visualized and Lie groups which can be elegantly algebraized When possible we present several facets of the same issue We believe that a good familiarity with the formalism of differential geometry is absolutely necessary in understanding and solving concrete problems and this is why we presented it in some detail Every new concept is supported by concrete examples interesting not only from an academic point of view Our interest is mainly in global questions and in particular the interdependence geometry topology local global We had to develop many algebraic topological techniques in the special context of smooth manifolds We spent a big portion of this book discussing the DeRham cohomology and its ramifications Poincaré duality intersection theory degree theory Thom isomorphism characteristic classes Gauss Bonnet etc We tried to calculate the cohomology groups of as many as possible concrete examples and we had to do this without relying on the powerful apparatus of homotopy theory CW complexes etc Some of the proofs are not the most direct ones but the means are sometimes more interesting than the ends For example in computing the cohomology of complex grassmannians we returned to classical invariant theory and used some brilliant but unadvertised old ideas In the last part of the book we discuss elliptic partial differential equations This requires a familiarity with functional analysis We painstakingly described the proofs of elliptic  $L_p$  and  $H^1$  estimates assuming some deep results of harmonic analysis for arbitrary elliptic operators with smooth coefficients It is not a light meal but the ideas are useful in a large number of instances We present a few applications of these techniques Hodge theory uniformization theorem We conclude with a close look to a very important class of elliptic operators namely the Dirac operators We discuss their algebraic structure in some detail Weizenböck formul and many concrete examples **Bulletin of the American Mathematical Society** American Mathematical Society, 1903 *Science* John Michels (Journalist), 1914 Vols for 1911-13 contain the Proceedings of the
