The Carbon Balance of Forest Biomes Howard Griffith, Paul Jarvis, 2004-03-01 The Carbon Balance of Forest Biomes provides an informed synthesis on the current status of forests and their future potential for carbon sequestration This volume is timely since convincing models which scale from local to regional carbon fluxes are needed to support these international agreements whilst criticisms have been levelled at existing empirical approaches One key question is to determine how well eddy flux measurements at the stand level represent regional scale processes This may be related to specific management practices age plantation fertilisation or simple bias in choosing representative sites ease of access roughness proximity to physical barriers The ecology and regeneration state of temperate tropical and boreal forests under current climatic conditions are discussed together with partitioning of photosynthetic and respiratory fluxes from soils and vegetation The volume considers how to integrate contrasting methodologies and the latest approaches for scaling from stand to the planetary boundary layer

Plant Growth and Climate Change James I. L. Morison, Michael D. Morecroft, 2008-04-15 Evidence grows daily of the changing climate and its impact on plants and animals Plant function is inextricably linked to climate and atmospheric carbon dioxide concentration On the shortest and smallest scales the climate affects the plant's immediate environment and so directly influences physiological processes At larger scales the climate influences species distribution and community composition as well as the viability of different crops in managed ecosystems Plant growth also influences the local regional and global climate through the exchanges of energy and gases between the

plants and the air around them Plant Growth and Climate Change examines the major aspects of how anthropogenic climate change affects plants focusing on several key determinants of plant growth atmospheric CO2 temperature water availability and the interactions between these factors The book demonstrates the variety of techniques used across plant science detailed physiology in controlled environments observational studies based on long term data sets field manipulation experiments and modelling It is directed at advanced level university students researchers and professionals across the range of plant science disciplines including plant physiology plant ecology and crop science It will also be of interest to earth system scientists

Wein, 2010-01-04 Drawing from a decade long collaboration between Japan and Russia this important volume presents the first major synthesis of current knowledge on the ecophysiology of the coniferous forests growing on permafrost at high latitudes It presents ecological data for a region long inaccessible to most scientists and raises important questions about the global carbon balance as these systems are affected by the changing climate Making up around 20% of the entire boreal forests of the northern hemisphere these permafrost forest ecosystems are subject to particular constraints in terms of temperature nutrient availability and root space creating exceptional ecosystem characteristics not known elsewhere This authoritative text explores their diversity structure dynamics and physiology It provides a comparison of these forests in relation to boreal forests elsewhere and concludes with an assessment of the potential responses of this unique biome to climate change The book will be invaluable to advanced students and researchers interested in boreal vegetation forest ecology silviculture and forest soils as well as to researchers into climate change and the global carbon balance
