One major concern of science education is preparing students to live in a rapidly changing society. In order to recognize, address, and shape new scientific and technological changes, students need not only understanding of scientific facts from the natural and physical sciences, but also problem-solving skills. These expert thinking skills do not develop spontaneously. Science educators must look for ways to encourage and develop such important inquiry skills in their students.

The recent incorporation of new information technologies into schools offers science education an unprecedented opportunity to reconsider traditional approaches to science curricula. In our instance, the integration of 16 microcomputers into a middle-class, eighth grade classroom has resulted in dramatic curricular changes. As researchers of the Computer as Lab Partner Project from the University of California at Berkeley, we are currently investigating the educational potential offered by Microcomputer-Based Laboratories (MBL)—a new class of probeware and software for real-time data collection and presentation. The Project's curriculum focused on three specific objectives: a) to teach the subject matter; b) to teach graph interpretation skills; and c) to foster students' scientific reasoning skills. This
