Central Nervous System

What is the central nervous system?

The central nervous system (CNS) consists of the brain and spinal cord. It is responsible for processing and coordinating sensory and motor information. The brain is divided into the cerebrum, cerebellum, and brainstem. The spinal cord is a long, thin, tube-like structure that runs down the back, protecting the spinal cord. It is composed of a series of segments, each containing a pair of spinal nerves. The CNS is protected by the meninges, which are three layers of tissue that surround the brain and spinal cord.

The spinal cord and nerves

The spinal cord is a long, thin, tube-like structure that runs down the back, protecting the spinal cord. It is composed of a series of segments, each containing a pair of spinal nerves. The spinal cord is responsible for carrying sensory information from the body to the brain, and for carrying motor information from the brain to the muscles and glands of the body. The spinal cord is protected by the meninges, which are three layers of tissue that surround the brain and spinal cord.

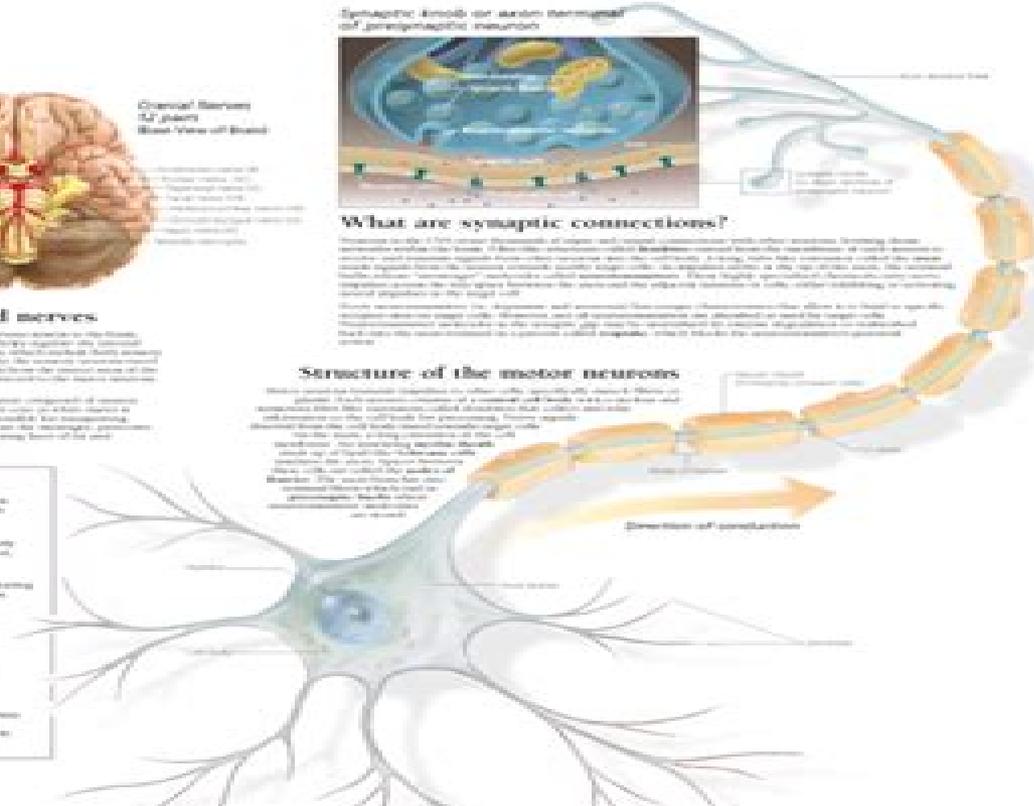

Structure of the motor neurons

Motor neurons are specialized cells that carry signals from the brain and spinal cord to the muscles and glands. They are composed of a cell body (soma) and a long, thin projection called an axon. The axon is covered by a myelin sheath, which is made up of Schwann cells. The myelin sheath helps to insulate the axon and speed up the transmission of electrical signals. The axon ends in a synaptic knob, which is the point where the motor neuron meets the muscle or gland. The synaptic knob is responsible for transmitting the signal to the muscle or gland.

Neurological disorders

Changes in the normal function of the brain, spinal cord, or nerves can lead to a variety of neurological disorders. These disorders can affect the brain, spinal cord, or nerves, and they can cause a wide range of symptoms. Some common neurological disorders include:

- Parkinson's disease:** A progressive neurodegenerative disorder that affects movement. It is caused by the loss of dopamine-producing neurons in the brain.
- Alzheimer's disease:** A neurodegenerative disorder that causes memory loss and cognitive decline. It is caused by the accumulation of amyloid plaques and neurofibrillary tangles in the brain.
- Epilepsy:** A chronic neurological disorder characterized by recurrent, unprovoked seizures. It is caused by abnormal electrical activity in the brain.
- Stroke:** A sudden interruption of blood flow to the brain, which can cause brain damage and lead to long-term disability. It is caused by a blood clot or a tear in a blood vessel in the brain.
- Multiple sclerosis (MS):** A chronic autoimmune disease that affects the central nervous system. It is caused by the immune system attacking the myelin sheath that surrounds the nerves.
- Huntington's disease:** A genetic disorder that causes involuntary movements and cognitive decline. It is caused by a mutation in the huntingtin gene.
- Tourette syndrome:** A neurological disorder characterized by repetitive, stereotyped, involuntary movements and vocalizations called tics. It is caused by abnormal brain activity.
- Chorea:** A neurological disorder characterized by involuntary, jerky movements. It is caused by abnormal brain activity.
- Dystonia:** A neurological disorder characterized by involuntary muscle contractions that cause abnormal postures and movements. It is caused by abnormal brain activity.
- Spasms:** Involuntary muscle contractions that cause pain and discomfort. They can be caused by a variety of factors, including stress, fatigue, and dehydration.
