

Is Stimulus Sampling Theory a Model?

- “The term ‘stimulus sampling theory’ refers to a number of theories differing with respect to special assumptions and their mathematical expression, yet sharing a common approach to conceptual representation of the stimulus situation and the formation of associative connections, rather than to a single coherent set of assumptions formulated to apply to all the experimental procedures employed in the study of learning” (p. 1).

behavior of rats in a T maze With the addition of new routines to specify the simulated environment of the simulated organism a similar basic program has learned to discriminate among visual patterns consisting of carelessly hand drawn alphabetic characters each of which is presented in a number of variations Input to the program is a binary representation of the presence or absence of parts of the figure in a 20 x 20 matrix superimposed on the figure to be recognized Each cell of the matrix is treated as a separate stimulus having various numbers of elements as associated with all the responses that can be made A random sample of elements from stimuli present in the visual field is used to determine the response any trial When a correct response is made all elements sampled on that trial become associated with that response Changes in learning rates occur as the probability of selecting available stimulus elements is changed
