Modelling, Control and Stability Analysis of Photovoltaic Systems in Power System Dynamic Studies Gustav Lammert, 2019 This thesis investigates the impact of i the low voltage ride through and dynamic voltage support capability ii the active current recovery rate iii the local voltage control and iv the plant level voltage control of large scale photovoltaic systems on short term voltage stability and fault induced delayed voltage recovery as well as transient and frequency stability The power system dynamic performance is analysed using state of the art methods such as phasor mode time domain simulations and the calculation of the critical clearing time that determines the stability margin Moreover the recently developed Kullback Leibler divergence measure is applied to assess the quality of the voltage recovery Drawbacks of this metric are outlined and a novel metric the so called voltage recovery index is defined that quantifies the delayed voltage recovery more systematically The studies are performed with a generic photovoltaic system model and typical model parameters are used that were determined in collaboration with

a manufacturer The stability analysis is performed in DiGSILENT PowerFactory using i a one load infinite bus system and ii an IEEE multi machine voltage stability test system namely the Nordic test system The results show that with the adequate control of photovoltaic systems power system dynamic performance can be significantly improved
