Survivable Optical WDM Networks Canhui (Sam) Ou, Biswanath Mukherjee, 2010-07-19 Survivable Optical WDM Networks investigates different approaches for designing and operating an optical network with the objectives that 1 more connections can be carried by a given network leading to more revenue and 2 connections can recover faster in case of failures leading to better services Different networks wavelength routed WDM networks wavelength routed WDM networks with sub wavelength granularity grooming and data over next generation SONET SDH over WDM networks are covered Different approaches are proposed to explore every aspect of a protection scheme such as 1 Protection granularity a At wavelength granularity b At sub wavelength granularity 2 Protection entity a Path protection b Sub path protection c Segment protection 3 Routing a Single path routing b Multi path routing Tradeoffs between different objectives e g resource efficiency vs recovery time are explored and practical approaches are proposed and analyzed *Design and Analysis of Survivable Wdm Optical Network* Minjing Mao, 2017-01-26 This dissertation Design and Analysis of Survivable WDM Optical Network by Minjing Mao was obtained from The University of Hong Kong Pokfulam Hong Kong and is being sold pursuant to Creative Commons Attribution 3.0 Hong Kong License The content of this dissertation has not been altered in any way We have altered the formatting in order to facilitate the ease of printing and reading of the dissertation All rights not granted by the above license are retained by the author Abstract Optical networks with Wavelength Division Multiplexing WDM technology provide huge bandwidth to meet the ever increasing traffic demand of the next generation Internet But the high speed nature of WDM networks also makes the network more vulnerable to failures Even a single network failure for a very short duration can result in enormous loss of data In this thesis we concentrate on designing a survivable WDM network In essence survivability concerns two important aspects fast fault detection and localization and fast fault recovery We first study fast fault detection and localization in WDM optical networks Our work is based on the notion of monitoring cycle m cycle Compared with other fault detection schemes an m cycle based fault detection scheme provides fast fault detection and requires less number of expensive monitors Aiming at further cutting down the implementation cost we propose the notion of super monitor Instead of having a dedicated monitor for each m cycle a single super monitor can be placed at the junction of a set of overlapped m cycles In this thesis we formulate and solve the monitor placement problem We then focus on enhancing the capacity efficiency of fast fault recovery schemes Shared backup path protection SBPP schemes can provide 100% protection against any single link failure This is achieved by establishing a pair of link disjoint active and backup paths upon each call arrival The bandwidth on different backup paths can be shared for protecting different calls In this thesis a new SBPP scheme is designed based on a two step routing approach where the active and backup paths are sequentially optimized with different objectives in mind We then shift our focus to design fast protection scheme for multicast broadcast communications To this end we refine the existing concept of blue red tree Blue red tree is a pair of spanning trees where

the connectivity between the root and any destination node is ensured upon a network failure. In particular, two efficient integer linear programs (ILPs) are formulated for finding the optimal blue/red trees. Last but not the least, we investigate the survivability in IP networks. We notice that existing efforts on IP fast reroute (IPFRR) are effective in enhancing the IP resilience. But the impact of IPFRR on the end-to-end TCP performance is ignored. Notably, path rerouting can interfere with the TCP congestion control mechanism and thus cause severe throughput degradation. To address this problem, we propose a duplicate acknowledgement (ACK) suppression scheme. The key idea is to detect whether an out-of-order packet arrival event is due to IPFRR or not. If it is due to IPFRR, duplicate ACKs triggered will be suppressed by the TCP receiver so as not to cause unnecessary slow-down at the TCP sender.

Survivability Approaches for Multiple Failures in WDM Optical Networks, Pallab Datta, 2005.

The explosive growth of Web-related services over the Internet is bringing millions of new users online, thus fueling an enormous demand for bandwidth. Wavelength-division multiplexed (WDM) networks employing wavelength routing have emerged as the dominant technology to satisfy this growing demand for bandwidth. As the amount of traffic carried has increased, any single failure can be catastrophic. Survivability becomes indispensable in such networks. Therefore, it is imperative to design networks that can quickly and efficiently recover from failures. Most research to date in survivable optical network design and operation focuses on single-link failures; however, the occurrence of multiple-link failures are not uncommon in a network topology. Multi-link failure scenarios can arise out of two common situations. First, an arbitrary link may fail in the network, and before that link can be repaired, another link fails, thus creating a multi-link failure sequence. Secondly, it might happen in practice that two distinct physical links may be routed via the same common duct or physical channel. A failure at that shared physical location creates a logical multiple-link failure. Such instances where separate fiber optic links share a common failure structure is often referred to as SRLG (Shared Risk Link Groups). In this dissertation, we study survivability paradigms for surviving multiple-link failures. We study the network design and upgrade problem in WDM backbone networks and formulate it using a simulated annealing-based technique. This framework provides a cost-effective way of upgrading the network by identifying how much resources to budget at each stage of network evolution. This results in significant cost reductions for the network service provider. We study protection reconfiguration using two different survivability paradigms, namely, sub-graph routing and shared mesh protection. Initially, sub-graphs are defined, taking into account link/SRLG or node failures, and could, in the event of an unrelated or subsequent multi-link failure, incorporate the reactive form of sub-graph fault tolerance. Reactive sub-graph fault tolerance employs a recursive approach for tolerating

numerous sequential overlapping failures It can tolerate simultaneous multiple link failures by simply serializing the handling of each individual fault Connection re routing and network reconfiguration is one of the primary challenges in sub graph routing methodology We propose a constrained subgraph routing methodology which restricts the connections to be routed using the same trunk and channel in the subgraphs thus minimizing reconfiguration The subgraph based routing methodology is further explored to tolerate multiple link failures in the form of shared risk link groups and node failures The generalized diverse routing problem for finding two diverse routes between a source and destination has been shown to be NP Complete Recent studies have also proven the NP completeness of the SRLG diverse routing We propose a polynomial time graph transformation algorithm for solving the diverse routing problem for certain specific SRLG s which includes link sets incident on a common node The proposed graph transformation methodology for diverse routing is also studied for shared risk node group SRNG failures

Novel Approaches and Architecture for Survivable Optical Internet Anwar Haque,2013 Any unexpected disruption to WDM Wavelength Division Multiplexing based optical networks which carry data traffic at tera bit per second may result in a huge loss to its end users and the carrier itself Thus survivability has been well recognized as one of the most important objectives in the design of optical Internet This thesis proposes a novel survivable routing architecture for the optical Internet We focus on a number of key issues that are essential to achieve the desired service scenarios including the tasks of a minimizing the total number of wavelengths used for establishing working and protection paths in WDM networks b minimizing the number of affected working paths in case of a link failure c handling large scale WDM mesh networks and d supporting both Quality of Service QoS and best effort based working lightpaths

Emerging Optical Network Technologies Krishna M. Sivalingam, Suresh Subramaniam, 2006-01-16 Optical networks have moved from laboratory settings and theoretical research to real world deployment and service oriented explorations. New technologies such as Ethernet PON, traffic grooming, regional and metropolitan network architectures and optical packet switching are being explored and the landscape is continuously and rapidly evolving. Some of the important issues involving these new technologies involve the architectural, protocol and performance related issues. This book addresses many of these issues and presents a bird's eye view of some of the more promising technologies. Researchers and those pursuing advanced degrees in this field will be able to see where progress is being made and new technologies are emerging.

Emerging Optical Network Technologies: Architectures, Protocols and Performance provides state of the art material written by the most prominent professionals in their respective areas.

WDM optical networks make it possible for the bandwidth of transport networks to reach a level on which any failures would cause tremendous data loss and affect a lot of users. Thus survivability issues of WDM optical networks have attracted a lot of research work. Within the scope of this dissertation two categories of problems are studied: one is survivable mapping from IP topology to WDM topology, the other is p cycle protection schemes in WDM networks.

WDM Mesh Networks: Management and Survivability examines several of the key management and survivability issues related to mesh based WDM networks and proposes new WDM network protocols and algorithms that could make telecommunication networks more efficient. The book focuses on various issues related to wavelength routed networks, namely routing and wavelength assignment, control and management, fault management and wavelength converter placement. Special consideration has been given to designing optical networks with survivability requirements. Network designers and planners and research and development engineers active in the field of telecommunications will find this book especially useful.

WDM Mesh Networks: Management and Survivability will also serve as a helpful reference for students of optical networking at the senior undergraduate and graduate levels.

Optical WDM Networks Biswanath Mukherjee, 2006-06-15

Research and development on optical wavelength division multiplexing WDM networks have matured considerably. While optics and electronics should be used appropriately for transmission and switching hardware, note that intelligence in any network comes from software for network control, management, signaling, traffic engineering, network planning, etc. The role of software in creating powerful network architectures for optical WDM networks is emphasized.

Optical WDM Networks is a textbook for graduate level courses. Its focus is on the networking aspects of optical networking but it also includes coverage of physical layers in optical networks. The author introduces WDM and its enabling technologies and discusses WDM local

access metro and long haul network architectures Each chapter is self contained has problems at the end of each chapter and the material is organized for self study as well as classroom use The material is the most recent and timely in capturing the state of the art in the fast moving field of optical WDM networking

On Optimal Survivability Design in WDM Optical Networks Under Scheduled Traffic Models Tianjian Li,2007 Wavelength division multiplexing WDM optical networks are widely viewed as the most appropriate choice for future Internet backbone with the potential to fulfill the ever growing demands for bandwidth WDM divides the enormous bandwidth of an optical fiber into many non overlapping wavelength channels each of which may operate at the rate of 10 Gigabit per second or higher A failure in a network such as a cable cut may result in a tremendous loss of data Therefore survivability is a very important issue in WDM optical networks The objective of this dissertation is to address the survivability provisioning problem in WDM optical networks under a scheduled traffic model and a sliding scheduled traffic model that we propose In contrast to the conventional traffic models considered in communication networks such as static traffic model and dynamic random traffic model the scheduled traffic model and the sliding scheduled traffic model are able to capture the traffic characteristics of applications that require capacity on a time limited basis They also give service providers more flexibility in provisioning the requested demands and a better opportunity to optimize the network resources The survivability provisioning problem is to determine a pair of link disjoint paths under the link failure model or a pair of SRLG disjoint paths under the Shared Risk Link Group SRLG failure model one working path and one protection path for each demand in a given set of traffic demands with the objective of minimizing the total resources used by all traffic demands while 100% restorability is guaranteed against any single failure To provision survivable service under the scheduled traffic model we develop two sets of integer linear program ILP formulations for joint and non joint optimizations using different protection schemes such as dedicated and shared path based protections We also design a capacity provision matrix based Iterative Survivable Routing ISR algorithm with different demand scheduling policies to solve the survivable routing and wavelength assignment RWA problem In addition we extend the heuristic algorithm design from dealing with single link failure to single SRLG failure The issue of survivability provisioning in WDM optical networks under the sliding scheduled traffic model has never been addressed by the research community In the dissertation we carry out the following tasks under

this traffic model a development of RWA ILP optimization formulations for dedicated and shared path based protection b design and implementation of efficient heuristic algorithms for shared path based protection Specifically in the proposed heuristic algorithm we introduce a demand time conflict reduction algorithm to minimize the time overlapping among a set of demands by properly placing a demand within its associated time window and c extending the heuristic algorithm design under the single link failure model to the single SRLG failure model
