for the Time-Varying Volume Data Tzi-Cker Chiueh, Institute for Computer Applications in Science and Engineering, 1997
Abstract This paper presents a strategy for efficiently rendering time varying volume data sets on a distributed memory parallel computer Time varying volume data take large storage space and visualizing them requires reading large files continuously or periodically throughout the course of the visualization process Instead of using all the processors to collectively render one volume at a time a pipelined rendering process is formed by partitioning processors into groups to render multiple volumes concurrently In this way the overall rendering time may be greatly reduced because the pipelined rendering tasks are overlapped with the I O required to load each volume into a group of processors moreover parallelization overhead may be reduced as a result of partitioning the processors We modify an existing parallel volume renderer to exploit various levels of rendering parallelism and to study how the partitioning of processors may lead to optimal rendering performance Two factors which are important to the overall execution time are resource utilization efficiency and pipeline startup latency The optimal partitioning configuration is the one that balances these two factors Tests on Intel Paragon computers show that in general optimal partitionings do exist for a given rendering task and result in 40 50% saving in overall rendering time Virtual Environments ,1998 **Biomedical Engineering and Design Handbook, Volume 2** Myer Kutz, 2009-07-13 A State of the Art Guide to Biomedical Engineering and Design Fundamentals and Applications The two volume Biomedical Engineering and Design Handbook Second Edition offers unsurpassed coverage of the entire biomedical engineering field including fundamental concepts design and development processes and applications This landmark work contains contributions on a wide range of topics from nearly 80 leading experts at universities medical centers and commercial and law firms Volume 2 provides timely information on breakthrough developments in medical device design diagnostic equipment design surgery rehabilitation engineering prosthetics design and clinical engineering Filled with more than 400 detailed illustrations this definitive volume examines cutting edge design and development methods for innovative devices techniques and treatments Volume 2 covers Medical Product Design FDA Medical Device Requirements Cardiovascular Devices Design of Respiratory Devices Design of Artificial Kidneys Design of Controlled Release Drug Delivery Systems Sterile Medical Device Package Development Design of Magnetic Resonance Systems Instrumentation Design for Ultrasonic Imaging The Principles of X Ray Computed Tomography Nuclear Medicine Imaging Instrumentation Breast Imaging Systems Surgical Simulation Technologies Computer Integrated Surgery and Medical Robotics Technology and Disabilities Applied Universal Design Design of Artificial Arms and Hands for Prosthetic Applications Design of Artificial Limbs for Lower Extremity Amputees Wear of Total Knee and Hip Joint Replacements Home Modification Design Intelligent Assistive Technology Rehabilitators Risk Management in Healthcare Technology Planning for Healthcare Institutions Healthcare Facilities Planning Healthcare Systems Engineering Enclosed Habitat Life Support *Real-time Imaging* ,2004 Wavelet Volume Rendering and Compression Masami Ueda, 1994 *Tutorial on Volume*
