*What Is Science?* Geoffreyson Khamala, 2014-11-15 Science is a human imperative Humans have always sought to understand the workings of the universe and our place in it From early on pioneer scientists speculated that daily life is governed by a universal plan They hypothesized that all phenomena human and natural conform to a general law They hypothesized that nature unfolds in a predictable way However in the quest to understand and explain unknown patterns in the physical world science has been described using opposing lenses Science was once understood as supernatural phenomenon mythology and tradition Science has also been explained as the quest for true knowledge wisdom Science is also understood as a form of knowledge that is knowledge of the natural world Today science is understood as an approach of acquiring comprehension or rather the scientific method These descriptions are almost certainly not precise This write up seeks to demonstrate that science is actually an adaptive capacity Science represents the incremental advancements in the way humans and other living lives harnesses nature to facilitate continued endurance Science is prompted by the truth that humans and other living lives have never come to terms with their fate Science is an essential part of the totality of human experience Science gives us more control over the world around us Technology facilitates the manipulation of the natural world to perpetuate life Accordingly what defines science is the purpose or goal not the method or any other decisive factor The purpose of science is to grasp and apply the underlying principles of nature to sustain life The universe was meant to last by means of unending adaptation Scientifically put the edict of the universe is to sustain life
