Understanding Cognitive Science:

Understanding Cognitive Science Michael McTear, 1988

Understanding Cognitive Science Michael R. W.

Dawson, 1998-11-02 This concise introduction to cognitive science provides undergraduate and graduate students with the theoretical foundations of classical and connectionist cognitive science to explain and teach the underlying unity of the field

Understanding Cognitive Science Michael F. McTear, 1988-10-01 Cognitive Science Jay Friedenberg, Gordon

Silverman, 2015-09-23 In *Cognitive Science 3e* Friedenberg and Silverman provide a solid understanding of the major theoretical and empirical contributions of cognitive science. Their text, thoroughly updated for this new third edition, describes the major theories of mind as well as the major experimental results that have emerged within each cognitive science discipline. Throughout history, different fields of inquiry have attempted to understand the great mystery of mind and answer questions like: What is the mind? How do we see, think, and remember? Can we create machines that are conscious and capable of self-awareness? This book examines these questions and many more. Focusing on the approach of a particular cognitive science field in each chapter, the authors describe its methodology, theoretical perspective, and findings, and then offer a critical evaluation of the field. Features: Offers a wide-ranging, comprehensive, and multidisciplinary introduction to the field of cognitive science and issues of mind. Interdisciplinary Crossroads sections at the end of each chapter focus on research topics that have been investigated from multiple perspectives, helping students to understand the link between varying disciplines and cognitive science. End of chapter Summing Up sections provide a concise summary of the major points addressed in each chapter to facilitate student comprehension and exam preparation. Explore More sections link students to the Student Study Site, where the authors have provided activities to help students more quickly master course content and prepare for examinations. Supplements: A password-protected Instructor's Resource contains PowerPoint lectures, a test bank, and other pedagogical material. The book's Study Site features web links, e-flash cards, and interactive quizzes. **Mind, Body, World**

Michael R. W. Dawson, 2013 Cognitive science arose in the 1950s when it became apparent that a number of disciplines, including psychology, computer science, linguistics, and philosophy, were fragmenting. Perhaps owing to the field's immediate origins in cybernetics, as well as to the foundational assumption that cognition is information processing, cognitive science initially seemed more unified than psychology. However, as a result of differing interpretations of the foundational assumption and dramatically divergent views of the meaning of the term information processing, three separate schools emerged: classical cognitive science, connectionist cognitive science, and embodied cognitive science. Examples, cases, and research findings taken from the wide range of phenomena studied by cognitive scientists effectively explain and explore the relationship among the three perspectives. Intended to introduce both graduate and senior undergraduate students to the foundations of cognitive science, *Mind, Body, World* addresses a number of questions currently being asked by those practicing in the field: What are the core assumptions of the three different schools? What are the relationships between these different sets of core

assumptions Is there only one cognitive science or are there many different cognitive sciences Giving the schools equal treatment and displaying a broad and deep understanding of the field Dawson highlights the fundamental tensions and lines of fragmentation that exist among the schools and provides a refreshing and unifying framework for students of cognitive science

Young Children's Developing Understanding of the Biological World Peter J. Marshall, Kimberly Brenneman, 2019-07-23 This book explores current research on young children's beliefs and knowledge about the biological world otherwise known as folkbiology Contributors discuss factors that shape the development of folkbiological knowledge as well as possible interventions designed to counteract cognitive biases that can interfere with the development of scientifically informed reasoning about natural phenomena Taken together the papers provide insights into the contributions of cognitive biases to the development of biological misunderstandings and into the life experiences and contexts that can contribute to or impede accurate learning of biological concepts As part of a wider literature the insights provided by the authors are relevant to the design of educational experiences that will foster children's exploration and further their understanding of life science ideas The chapters in this book were originally published as a special issue of *Early Education and Development*

Understanding Cognitive Development Barbara Landau, 2016-09-17 The papers in this volume examine the state of the art in key areas of developmental cognitive neuroscience focusing on theoretically driven research on cognition and its development The past decade has seen an increasing number of empirical papers on the relationship between brain and cognitive development But despite the clearly burgeoning interest in this topic there is a relative paucity of work motivated by deep theoretical questions about the nature of cognition and its development Many papers are still in the mode of reporting brain cognition correlations with a focus on regional activations during brain imaging a useful approach but one that is limited with respect to its contributions to understanding the structure of cognition and its development The papers in this special issue of *Cognitive Neuropsychology* consider a number of domains and mechanisms in cognition including language number space faces reading memory and attention and represent the wealth of approaches and techniques that can be used to shed light on the nature of cognitive development in brain and mind These include cross species comparisons studies of development under experiential deprivation or genetic differences classical developmental experimentation and imaging techniques such as NIRS and fMRI which have recently been applied to developmental questions The combination of solid theorizing together with a broad range of approaches allows a critical but constructive look at the latest findings in the field relevant to answering enduring questions about cognition its development and its realization in the developing brain

What levels of explanation in the behavioural sciences? Giuseppe Boccignone,Roberto Cordeschi,2015-07-03 Complex systems are to be seen as typically having multiple levels of organization For instance in the behavioural and cognitive sciences there has been a long lasting trend promoted by the seminal work of David Marr putting focus on three distinct levels of analysis the computational level accounting for the What and Why issues the algorithmic and the implementational levels specifying the How problem However the tremendous developments in neuroscience knowledge about processes at different scales of organization together with the complexity of today cognitive theories suggest that there will hardly be only three levels of explanation Instead there will be many different degrees of commitments corresponding to the different granularities from high level behavioural models to low level neural and molecular models of the cognitive research program For instance Bayesian approaches that are usually advocated for formalizing Marr s computational level and rational behaviour have even been adopted to model synaptic plasticity and axon guidance by molecular gradients As a result we can consider the behavioural scientist as dealing with models at a multiplicity of levels The purpose of this Research Topic in Frontiers in Theoretical and Philosophical Psychology is to promote an approach to the role of the levels and explanation and models which is of interest for cognitive scientists neuroscientists psychologists behavioural scientists and philosophers of science
