Connectionism in Perspective R. Pfeifer, Z. Schreter, F. Fogelman-Soulié, L. Steels, 1989-08-23 An evaluation of the merits potential and limits of Connectionism this book also illustrates current research programs and recent trends Connectionism also known as Neural Networks is an exciting new field which has brought together researchers from different areas such as artificial intelligence computer science cognitive science neuroscience physics and complex dynamics These researchers are applying the connectionist paradigm in an interdisciplinary way to the analysis and design of intelligent systems In this book researchers from the above mentioned fields not only report on their most recent research results but also describe Connectionism from the perspective of their own field looking at issues such as the effects and the utility of Connectionism for their field the potential and limitations of Connectionism can it be combined with other approaches Theoretical Aspects of Neural Computation: A Multidisciplinary Perspective Kwok-Yee M. Wong, Dit-Yan Yeung, 1998-06 Over the past decade or so neural computation has emerged as a research area with active involvement by researchers from a number of different disciplines including computer science engineering mathematics neurobiology physics and statistics The workshop brought together researchers with a diverse background to review the current status of neural computation research Three aspects of neural computation have been emphasized neuroscience aspects computational and Mathematical aspects and statistical physics aspects This book contains 28 contributions from frontier researchers in these fields Thoroughly re edited and in some cases revised post workshop these papers collated into this review volume provide a top class reference summary of the state of the art work done in this field **A Computational Perspective on Visual Attention** John K. Tsotsos, 2021-06-22 The derivation exposition and justification of the Selective Tuning model of vision and attention Although William James declared in 1890 Everyone knows what attention is today there are many different and sometimes opposing views on the subject This fragmented theoretical landscape may be because most of the theories and models of attention offer explanations in natural language or in a pictorial manner rather than providing a quantitative and unambiguous statement of the theory They focus on the manifestations of attention instead of its rationale In this book John Tsotsos develops a formal model of visual attention with the goal of providing a theoretical explanation for why humans and animals must have the capacity to attend He takes a unique approach to the theory using the full breadth of the language of computation rather than simply the language of mathematics as the formal means of description The result the Selective Tuning model of vision and attention explains attentive behavior in humans and provides a foundation for building computer systems that see with human like characteristics The overarching conclusion is that human vision is based on a general purpose processor that can be dynamically tuned to the task and the scene viewed on a moment by moment basis Tsotsos offers a comprehensive up to date overview of attention theories and models and a full description of the Selective Tuning model confining the formal elements to two chapters and two appendixes The text is accompanied by more than 100

illustrations in black and white and color additional color illustrations and movies are available on the book's Web site
