Transport in Transition Regimes Naoufel Ben-Abdallah, 2004 IMA Volumes 135 *Transport in Transition Regimes* and 136 *Dispersive Transport Equations and Multiscale Models* focus on the modeling of processes for which transport is one of the most complicated components This includes processes that involve a wide range of length scales over different spatio-temporal regions of the problem ranging from the order of mean free paths to many times this scale Consequently effective modeling techniques require different transport models in each region The first issue is that of finding efficient simulations techniques since a fully resolved kinetic simulation is often impractical One therefore develops homogenization stochastic or moment based subgrid models Another issue is to quantify the discrepancy between macroscopic models and the underlying kinetic description especially when dispersive effects become macroscopic for example due to quantum effects in semiconductors and superfluids These two volumes address these questions in relation to a wide variety of application areas such as semiconductors plasmas fluids chemically reactive gases etc

**Transport Transitions: Advancing Sustainable and Inclusive Mobility** Ciaran McNally, Páraic Carroll, Beatriz Martinez-Pastor, Bidisha Ghosh, Marina Efthymiou, Nikolaos Valantasis-Kanellos, 2025-03-06 This is an open access book It gathers the proceedings of the 10th edition of Transport Research Arena TRA 2024 held on 15-18 April 2024 in Dublin Ireland Contributions cover a wide range of research findings methodological aspects technologies and policy issues that are currently reshaping the transport and mobility system in different parts of Europe Bridging between academic research industrial developments and regulations this book offers a comprehensive review of the state of the art in transportation with a special emphasis on topics concerning digital transition in transport and inclusive and sustainable mobility alike This is the second volume of a 6 volume set *The Governance of Smart Transportation Systems* Matthias Finger, Maxime Audouin, 2018-08-22 This book presents essential new governance structures to embrace and regulate smart mobility modes Drawing on a range of case studies it paves the way for new approaches to governing future transportation systems Over the past decades Information and Communication Technologies have enabled the development of new mobility solutions that have completely redefined traditional and well established urban transportation systems Urban transportation systems are evolving dramatically from the development of shared mobility modes to the advent of electric mobility and from the automated mobility trend to the rapid spread of integrated transportation schemes Given the disruptive nature of those new mobility solutions new governance structures are needed Through a series of case studies from around the world this book highlights governance and regulatory processes having supported or sometimes prevented the development and implementation of smart mobility solutions shared automated electric integrated The combination of chapters offers a comprehensive overview of the different research endeavours focusing on the governance of smart transportation systems and will help pave the way for this important subject which is crucial for the future of cities

*Mechanics of Sediment Transportation and Alluvial Stream Problems* R. J. Garde, K. G.

**Equilibrium and Transfer in Porous Media 2** Jean-François Daïan,2014-05-12 A porous medium is composed of a solid matrix and its geometrical complement the pore space This pore space can be occupied by one or more fluids The understanding of transport phenomena in porous media is a challenging intellectual task This book provides a detailed analysis of the aspects required for the understanding of many experimental techniques in the field of porous media transport phenomena It is aimed at students or engineers who may not be looking specifically to become theoreticians in porous media but wish to integrate knowledge of porous media with their previous scientific culture or who may have encountered them when dealing with a technological problem While avoiding the details of the more mathematical and abstract developments of the theories of macroscopization the author gives as accurate and rigorous an idea as possible of the methods used to establish the major laws of macroscopic behavior in porous media He also illustrates the constitutive laws and equations by demonstrating some of their classical applications Priority is to put forward the constitutive laws in concrete circumstances without going into technical detail This second volume in the three volume series focuses on transport and transfer from homogeneous phases to porous media and isothermal transport in the pore space
