What is Diabetes?

Diabetes is a group of metabolic disorders characterized by a chronic elevation in the blood glucose levels. It occurs when the body does not produce enough insulin, or the insulin it produces does not work properly. Without proper treatment, diabetes can lead to serious complications, such as heart disease, kidney failure, blindness, and nerve damage.

Types of Diabetes

There are three main types of diabetes: Type 1, Type 2, and Gestational Diabetes. Type 1 is an autoimmune disease where the body's immune system attacks the insulin-producing cells in the pancreas. Type 2 is a chronic condition where the body's cells become resistant to insulin, and the pancreas cannot produce enough insulin to overcome this resistance. Gestational Diabetes is a temporary condition that occurs during pregnancy.

What is Insulin?

Insulin is a hormone produced by the pancreas that helps cells take up glucose from the blood. It is essential for the body to use glucose for energy. Without insulin, glucose cannot enter the cells, and the body's cells starve for energy.

The liver takes up glucose, converts it into glycogen and stores it.

Glucose signals the liver to convert glycogen to glucose and release the glucose into the blood.

The conversion of glycogen into glucose is called gluconeogenesis and occurs in the liver and kidneys.

Type 1 Diabetes: In this condition, the body's immune system attacks the insulin-producing cells in the pancreas. This leads to a complete or near-complete loss of insulin production. The body cannot use glucose for energy, and the blood glucose levels rise. This is a chronic condition that requires lifelong insulin therapy.

Type 2 Diabetes: This condition occurs when the body's cells become resistant to the action of insulin. The pancreas may still produce insulin, but the cells do not respond to it properly. Over time, the pancreas may also become less able to produce enough insulin to overcome the resistance. This is a chronic condition that can be managed with lifestyle changes, oral medications, and sometimes insulin therapy.

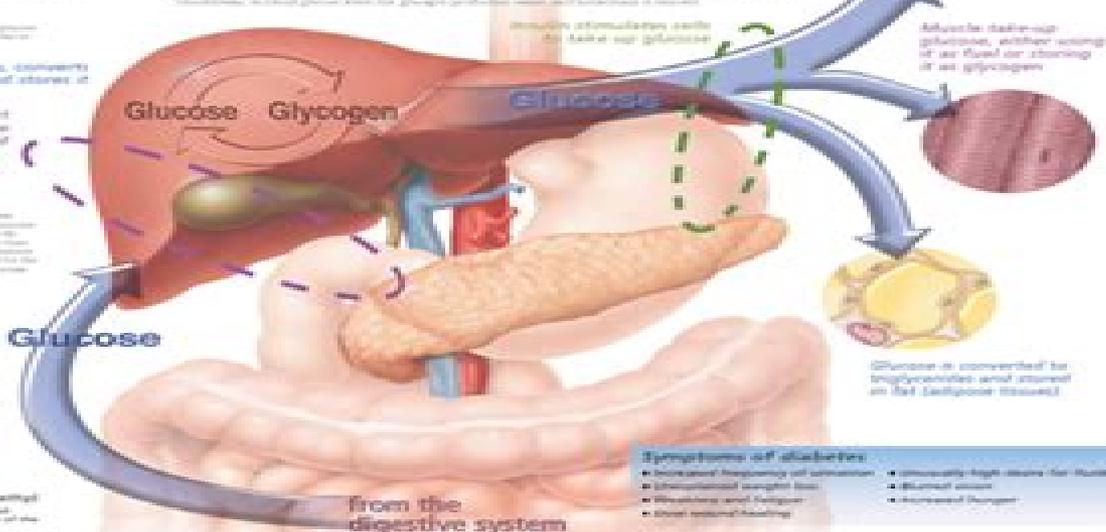

What is Glucose?

Glucose is a type of sugar and is the body's main source of energy. It is produced in the liver from carbohydrates and stored in the liver and muscles. The body uses glucose for energy to power its cells.

Glucose Metabolism

Glucose is a type of sugar and is the body's main source of energy. It is produced in the liver from carbohydrates and stored in the liver and muscles. The body uses glucose for energy to power its cells. The liver stimulates cells to take up glucose. Muscle takes up glucose, either using it as fuel or storing it as glycogen. Glucose is converted to triglycerides and stored in fat (adipose tissue).
