

# Understanding GERD

## Gastroesophageal Reflux Disease

### What is GERD?

The esophagus is the tube that carries food and liquid from the mouth to the stomach. At the junction of the esophagus and the stomach, there is a valve called the lower esophageal sphincter (LES). This valve normally contracts to prevent stomach contents from flowing back up into the esophagus. When the LES does not contract properly, stomach acid can flow back up into the esophagus, causing irritation and inflammation. This is called GERD.

Other symptoms of GERD include the backflow of stomach contents into the throat and mouth, especially when lying down or sleeping, and chronic cough, asthma, hoarseness, and a sore throat. In some cases, GERD can lead to more serious complications, such as Barrett's esophagus, which is a precancerous condition of the esophagus.

### The lower esophageal sphincter

The lower esophageal sphincter (LES) is a ring of muscle that acts as a valve between the esophagus and the stomach. It normally contracts to prevent stomach acid from flowing back up into the esophagus. When the LES does not contract properly, stomach acid can flow back up into the esophagus, causing irritation and inflammation. This is called GERD.

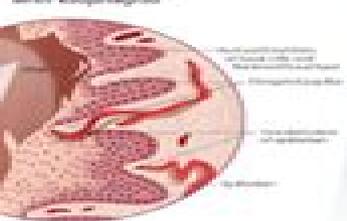

Lower esophageal sphincter (normally closed)

Lower esophageal sphincter (normal)

### Esophageal lining with esophagitis

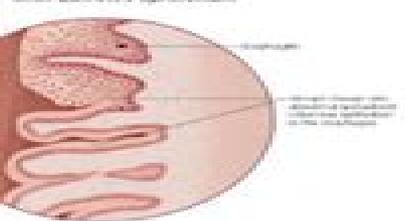

### Esophagitis

Esophagitis is inflammation of the lining of the esophagus. It is caused by stomach acid flowing back up into the esophagus. The acid irritates the lining, causing inflammation and damage to the cells. This can lead to symptoms such as heartburn, chest pain, and difficulty swallowing.

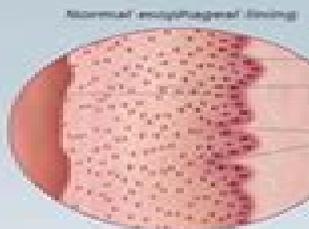

### Esophageal lining with Barrett's esophagus

### Barrett's esophagus

Barrett's esophagus is a condition in which the lining of the esophagus changes from normal squamous cells to columnar cells. This change is caused by chronic acid reflux. Barrett's esophagus is a precancerous condition that can lead to esophageal cancer. It is diagnosed by endoscopy and biopsy.

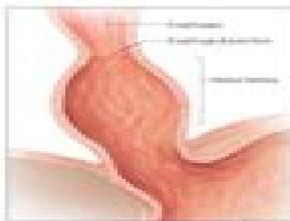

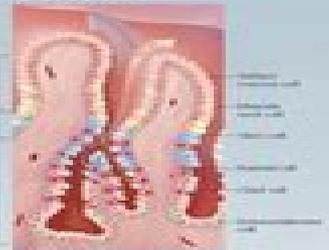

### Taking control of GERD

- Eat a balanced diet with a low-fat, low-spice diet.
- Avoid alcohol, caffeine, and tobacco.
- Lose weight if you are overweight.
- Eat smaller meals more often.
- Do not lie down for at least 2-3 hours after eating.
- Avoid wearing tight-fitting clothing.
- Elevate the head of your bed.
- Avoid smoking and drinking alcohol.
- Avoid taking NSAIDs and aspirin.

### Stomach acid

Stomach acid is a mixture of hydrochloric acid and enzymes that help break down food. It is produced by the stomach and is essential for digestion. However, too much stomach acid can cause heartburn and other symptoms of GERD.

### Gastric gland

Hiatal hernia

### Hiatal hernia and GERD

A hiatal hernia occurs when the stomach protrudes through the diaphragm. This can lead to GERD because the stomach is no longer fully supported by the diaphragm, allowing stomach acid to flow back up into the esophagus.

### Diet and medication

**Diet:** Eat a balanced diet with a low-fat, low-spice diet. Avoid alcohol, caffeine, and tobacco. Lose weight if you are overweight. Eat smaller meals more often. Do not lie down for at least 2-3 hours after eating. Avoid wearing tight-fitting clothing. Elevate the head of your bed. Avoid smoking and drinking alcohol. Avoid taking NSAIDs and aspirin.

**Medication:** Antacids, H2 blockers, and proton pump inhibitors.
