## **Space Nuclear Power:**

**Artificial Space Debris** Nicholas L. Johnson, Darren S. McKnight, 1987

**The Role of Nuclear Power and Nuclear Propulsion in the Peaceful Exploration of Space** International Atomic Energy Agency, 2005 This publication provides details of a variety of radioisotope power systems shows in what circumstances they surpass other power systems and provides the history of the space missions in which they have been employed The book also summarizes the use of on board reactors and the testing done on reactor rocket thrusters as well as provides a review of current technology a consideration of future applications and a bibliography of further information on space nuclear technology This publication also attempts to identify those R D areas where space related nuclear power systems can be of practical relevance to efforts in innovative reactor and fuel cycle technology development that are currently being pursued within various international collaboration frameworks

**A Critical Review of Space Nuclear Power and Propulsion 1984-1993** Mohamed S. El-Genk, 1994 Market Researchers in nuclear power physicists chemical and nuclear engineers students and policy makers The papers in this volume summarize key technological advancements that occurred during the ten years from 1984 to 1993 in such areas as heat pipe technology fuels space nuclear safety dynamic power conversion systems and advanced radiator technologies for spacecraft power systems In light of new industry initiatives to form a consortia and the possibility of bi modal space nuclear power and propulsion systems this informative volume will be an invaluable reference source

**Space Nuclear Fission Electric Power Systems** David Buden, 2011 The advantages of space nuclear fission power systems can be summarized as compact size low to moderate mass long operating lifetimes the ability to operate in extremely hostile environments operation independent of the distance from the Sun or of the orientation to the Sun and high system reliability and autonomy In fact as power requirements approach the tens of kilowatts and megawatts fission nuclear energy appears to be the only realistic power option The building blocks for space nuclear fission electric power systems include the reactor as the heat source power generation equipment to convert the thermal energy to electrical power waste heat rejection radiators and shielding to protect the spacecraft payload The power generation equipment can take the form of either static electrical conversion elements that have no moving parts e g thermoelectric or thermionic or dynamic conversion components e g the Rankine Brayton or Stirling cycle The U S has only demonstrated in space or even in full systems in a simulated ground environment uranium zirconium hydride reactor power plants These power plants were designed for a limited lifetime of one year and the mass of scaled up power plants would probably be unacceptable to meet future mission needs Extensive development was performed on the liquid metal cooled SP 100 power systems and components were well on their way to being tested in a relevant environment A generic flight system design was completed for a seven year operating lifetime power plant but not built or tested The former USSR made extensive use of space reactors as a power source for radar ocean reconnaissance satellites They launched some 31 missions using reactors with thermoelectric power conversion systems and

two with thermionic converters Current activities are centered on Fission Surface Power for lunar applications Activities are concentrating on demonstrating component readiness This book will discuss the components that make up a nuclear fission power system the principal requirements and safety issues various development programs status of developments and development issues *Space Nuclear Power Applications* United States. Congress. Joint Committee on Atomic Energy, United States. Congress. Joint Committee on Atomic Energy. Subcommittee on Research, Development, and Radiation, 1962 *THE PRACTICAL APPLICATION OF SPACE NUCLEAR POWER IN THE 1960'S*, 1961 Nuclear reactor space electric power units under development in the U S include the SNAP 2 SNAP 8 and SNAP 10 The electric power output of these Systems for Nuclear Auxiliary Power SNAP extends over three decades of power from 300 watts to 60 kilowatts The major operational installation and handling characteristics of these nuclear power units are described In particular some limitations and restrictions with regard to payload shielding and radiation environment are described with respect to the power plants their mode of installation and system weight The ground handling and safety as well as the over all safety aspects of space reactor utilization are also described The SNAP 10 power unit is a demonstration system that utilizes thermoelectric power conversion The SNAP 2 power system utilizes a similar compact nuclear reactor which is cooled with liquid sodium potassium alloy and coupled to a small mercury vapor turbine generator power conversion system The SNAP 8 system is a direct outgrowth of the SNAP 2 power plant development It will deliver 30 000 watts with one mercury vapor turbine generator system and weighs about 1400 auth *Space Nuclear Power Systems, 1985* Mohamed S. El-Genk, Mark D. Hoover, 1987 *Atomic Power in Space II*, 2015 Beginning with a brief overview of the programs and systems developed through the late 1970s Atomic Power in Space II traces the development and use of space nuclear power systems including the missions and programs for which they were developed to the present day from preface *The Space Nuclear Reactor Program* United States. Congress. House. Committee on Science and Technology. Subcommittee on Energy Research and Production, 1983 *Priorities in Space Science Enabled by Nuclear Power and Propulsion* National Research Council, Division on Engineering and Physical Sciences, Aeronautics and Space Engineering Board, Space Studies Board, Committee on Priorities for Space Science Enabled by Nuclear Power and Propulsion, 2006-04-20 In 2003 NASA began an R D effort to develop nuclear power and propulsion systems for solar system exploration This activity renamed Project Prometheus in 2004 was initiated because of the inherent limitations in photovoltaic and chemical propulsion systems in reaching many solar system objectives To help determine appropriate missions for a nuclear power and propulsion capability NASA asked the NRC for an independent assessment of potentially highly meritorious missions that may be enabled if space nuclear systems became operational This report provides a series of space science objectives and missions that could be so enabled in the period beyond 2015 in the areas of astronomy and astrophysics solar system exploration and solar and space physics It is based on but does not reprioritize the findings of previous NRC decadal surveys in those three areas *Nuclear*

*Power in Space* United States. Congress. House. Committee on Science, Space, and Technology. Subcommittee on Energy Research and Development,1989      Energy Research Abstracts ,1986      *Nuclear Power Supplies* ,1985 The anticipated growth of the space station power requirement provides a good example of the problem the space nuclear power supply developers have to contend with should a reactor power supply be developed that attempts to be all things to all missions i e is highly flexible in its ability to meet a wide variety of missions or should the development of a reactor system await a specific mission definition and be customized to this mission This leads of course to a chicken and egg situation For power requirements of several hundreds of kilowatts or more no nuclear power source exists or is even far enough along in the definition stage much less the development stage for NASA to reasonably assume probable availability within the next 10 years The real problem of space nuclear power is this chicken and egg syndrome DOE will not develop a space reactor system for NASA without a firm mission and NASA will not specify a firm mission requiring a space reactor because such a system doesn t exist and is perceived not to be developable within the time frame of the mission The problem is how to break this cycle The SP 100 program has taken an important first step to breaking this cycle but this program is much more design specific than what is required to achieve a broad technology base and latitude in achievable power level In contrast to the SP 100 approach a wider perspective is required the development of the appropriate technologies for power levels can be broken into ranges say from 100 kWe to 1000 kWe and from 1000 kWe to 10 000 kWe      **Proceedings of the Eighth Symposium on Space Nuclear Power Systems** Symposium on Space Nuclear Power Systems,1991      **Cosmos 1900 and the Future of Space Nuclear Power** United States. Congress. Senate. Committee on Energy and Natural Resources,1989      Nuclear Power in Space United States. Department of Energy. Office of Public Affairs,1978      **Space Nuclear Power Generation, Conversion, and Storage for the Nineties and Beyond** United States. Congress. House. Committee on Science and Technology.
