already critically short and many of the residents are impoverished Even today more than 1 billion people do not have access to safe and affordable drinking water and perhaps twice that many lack adequate sanitation services In fact inadequate drinking water quality is a leading cause of infant mortality worldwide This requires proper management during planning construction and installation operation and maintenance of the entire system from catchment to consumer Also good understanding of these processes facilitates early identification of potentially present weaknesses Projections of global water needs are worrisome enough when the water demands arising from future population and economic growth are compared with current estimates of developed and developable supplies However the reliability of current supplies is also in question The fact is that there are trends and circumstances which will almost certainly reduce available supplies in the face of sharply escalating water demands world wide This Book *Drinking Water* focuses on fundamental and applied research in water sources substances drinking water treatment processes distribution systems and residual management The book covers a wide range of current issues reflecting on current problems and demonstrating the complexity of water management This book will be of valuable for scientists and researchers and engineers from water supply companies and engineering consulting firms

**Hydrology** Franca Masin,2017-10 Hydrology is the science that deals with the processes governing the depletion and replenishment of water resources of the earth s land areas It also refers to the cycling of liquids such as hydrocarbons on other planets It focuses on the distribution of water in the subsurface surface and atmosphere the chemistry of that water and the effects of climate on the water cycle Measurement is fundamental for assessing water resources Research in this field provides a better understanding of the processes involved in the hydrologic cycle and insight for environmental engineering policy and planning Particularly noteworthy for the department are our research achievements in numerical and physical models for water and sediment flow in rivers and reservoirs An important research subject is the studying of global and regional changes in the hydrological cycle This can have various causes such as climate changes and other human interference e g extensive forest clearance With the help of process and field studies together with statistical and physical modeling one can study how the hydrological cycle and water balance are affected This book *Hydrology* provides some of the scientific technologic and policy aspects of the field of Hydrology It covers the study of the movement distribution and quality of water throughout earth and thus addresses both the hydrologic cycle and water resources It provides a better understanding of the processes involved in the hydrologic cycle and insight for environmental engineering policy and planning The studies also encompass water quality modeling in particular pollution of field and groundwater and the transport and degradation of pollutants This book will be of valuable for practicing professionals and students mathematical modelers hydrogeologists and water resources specialists *Global Water* Glenn E.
