Transport and Microstructural Phenomena in Oxide Electronics David S. Ginley, 2001 Oxide materials are rapidly impacting a broad spectrum of optoelectronic applications from energy conservation to communications and computer memory Developing a better understanding of the relationships between transport and microstructural phenomena is critical to the continued evolution of these applications This volume reports on new materials and improved growth of films and offers a much deeper level of understanding of the key determinates affecting the electro optical performance of oxide based devices Transparent conducting oxides TCOs with a focus on p type materials are highlighted One of the most exciting results in the TCO area is the report of CuInO_2 where the material was doped n type with Sn^{4+} and p type with Ca^{2+} This is the first proven TCO system where homojunctions should be possible Ferroelectric materials are another family of materials emerging in the area of DRAM and frequency agile microwave electronics A number of papers focus on the methods of controlling the interfacial properties of ferroelectric materials such as BaSrTiO_3 on a variety of substrates A number of groups are approaching atomic level control of interfaces allowing for the deposition of high quality materials on substrates as diverse as Si and MgO Embedded strain from the growth process for ferroelectric materials and other oxide systems is also demonstrated to be a critical determinate of the film And a new model for ferroelectric materials indicates that a nanopolar reorientation transition may be responsible for the marked increase in dielectric tuning for nonstressed films Topics include transparent conducting oxides transport and microstructural phenomena in oxide electronics oxide based devices ferroelectric materials and oxide thin film growth

Processing-microstructure-property Relationships of Tin Oxide Thin Films for Gas Sensor Applications Li Fu, 2000 Thin films with different microstructures were obtained by using two deposition techniques namely pulsed laser deposition PLD and electron beam evaporation and a variety of substrates such as Al_2O_3 1012 Al_2O_3 1120 and Al_2O_3 0001 The obtained SnO_2 thin films include single crystalline films compact epitaxial films with different grain boundary density and porous films with rough surface Property measurements reveal that single crystal has low gas sensitivity and the performance of compact films depends on the grain boundary density On the other hand porous films exhibit high sensitivity Based on the experimental results a model is proposed to interpret the observed phenomena in terms of depletion and grain boundary

Materials and Devices for Smart Systems Materials Research Society, Fall Meeting, 2004 Combustion Synthesis of Metal/metal Oxide Nanocomposite Materials Tiffany Aimée Miller, 2005. In the current work a new method for the synthesis of nanocomposite materials is demonstrated. The technique is based on the hypothesis that staged decomposition and nucleation of multi phase precursors and products can be used to create nanocomposite materials in a combustion system. As part of this work a novel particle feed system PFS has been developed to inject solid phase particle precursor materials into the reaction zone of a multi element diffusion flame burner, a Hencken burner.
