Transformation Methods for Nonlinear Partial Differential Equations Dominic G. B. Edelen,Jian-hua Wang,1992 The purpose of the book is to provide research workers in applied mathematics physics and engineering with

practical geometric methods for solving systems of nonlinear partial differential equations The first two chapters provide an introduction to the more or less classical results of Lie dealing with symmetries and similarity solutions The results however are presented in the context of contact manifolds rather than the usual jet bundle formulation and provide a number of new conclusions The remaining three chapters present essentially new methods of solution that are based on recent publications of the authors The text contains numerous fully worked examples so that the reader can fully appreciate the power and scope of the new methods In effect the problem of solving systems of nonlinear partial differential equations is reduced to the problem of solving families of autonomous ordinary differential equations This allows the graphs of solutions of the system of partial differential equations to be realized as certain leaves of a foliation of an appropriately defined contact manifold In fact it is often possible to obtain families of solutions whose graphs foliate an open subset of the contact manifold These ideas are extended in the final chapter by developing the theory of transformations that map a foliation of a contact manifold onto a foliation This analysis gives rise to results of surprising depth and practical significance In particular an extended Hamilton Jacobi method for solving systems of partial differential equations is obtained   Partial Differential Equations N.D. Bellman,G. Adomian,2012-12-06 The purpose of this book is to present some new methods in the treatment of partial differential equations Some of these methods lead to effective numerical algorithms when combined with the digital computer Also presented is a useful chapter on Green s functions which generalizes after an introduction to new methods of obtaining Green s functions for partial differential operators Finally some very new material is presented on solving partial differential equations by Adomian s decomposition methodology This method can yield realistic computable solutions for linear or non linear cases even for strong nonlinearities and also for deterministic or stochastic cases again even if strong stochasticity is involved Some interesting examples are discussed here and are to be followed by a book dealing with frontier applications in physics and engineering In Chapter I it is shown that a use of positive operators can lead to monotone convergence for various classes of nonlinear partial differential equations In Chapter II the utility of conservation technique is shown These techniques are suggested by physical principles In Chapter III it is shown that dyn mic programming applied to variational problems leads to interesting classes of nonlinear partial differential equations In Chapter IV this is investigated in greater detail In Chapter V we show that the use of a transformation suggested by dynamic programming leads to a new method of successive approximations   Introduction to Partial Differential Equations K. Sankara Rao,2010-07-30 Provides students with the fundamental concepts the underlying principles and various well known mathematical techniques and methods such as Laplace and Fourier transform techniques the variable separable method and Green s function method to solve partial differential equations It is supported by miscellaneous examples to enable students to assimilate the fundamental concepts and the techniques for solving PDEs with various initial and boundary conditions   Applied Partial Differential Equations Donald W. Trim,1990 The emphasis in this book is placed on techniques for solving

partial differential equations found in physics and engineering but discussions on existence and uniqueness of solutions are included Several different methods of solution are presented with the primary emphasis on the classical method of separation of variables Secondary emphasis is placed on transform solutions as well as on the method of Green s functions
