Systolic Computations:

Systolic Computations M.A. Frumkin, 2012-12-06 This monograph is devoted to a new method of parallel computing which uses VLSI technology in an efficient manner. By this method data are fed to the cells of a systolic processor and results are obtained instantly. Some theoretical and algorithmic questions which arise in the design of hardware and software for systolic processing are considered. Special attention is devoted to the complexity of VLSI complexity of algorithms, parallel algorithms, relations between graphs of algorithms and graphs of processors, parallel programming languages, and the use of systolic algorithms for vector programming. The book is unique for its inclusion of a library of systolic algorithms for solving problems from twelve branches of computer science and will be useful for designers of hardware and software for parallel processing.

Concurrent Computations Stuart K. Tewksbury, Bradley Dickinson, Stuart C. Schwartz, 2012-12-06 The 1987 Princeton Workshop on Algorithm Architecture and Technology Issues for Models of Concurrent Computation was organized as an interdisciplinary workshop emphasizing current research directions toward concurrent computing systems. With participants from several different fields of specialization, the workshop covered a wide variety of topics, though by no means a complete cross section of issues in this rapidly moving field. The papers included in this book were prepared for the workshop and taken together provide a view of the broad range of issues and alternative directions being explored. To organize the various papers, the book has been divided into five parts. Part I considers new technology directions. Part II emphasizes underlying theoretical issues. Communication issues, which are addressed in the majority of papers, are specifically highlighted in Part III. Part IV includes papers stressing the fault tolerance and reliability of systems. Finally, Part V includes systems-oriented papers where the system ranges from VLSI circuits through powerful parallel computers. Much of the initial planning of the workshop was completed through an informal AT&T Bell Laboratories group consisting of Mehdi Hatamian, Vijay Kumar, Adrian Ligtenberg, Sailesh Rao, P. Subrahmanyam, and myself. We are grateful to Stuart Schwartz both for the support of Princeton University and for his organizing local arrangements for the workshop and to the members of the organizing committee whose recommendations for participants and discussion topics were particularly helpful.

A. T. Rosenberg and A. T. Transputing '91 Peter Welch, Toshiyasu L. Kunii, A. Bakkers, 1991 Transputers constitute a revolutionary category of microprocessors for parallel processing which have become market leaders in 32-bit RISC architectures. The wide range of applications has caused a multitude of activities of user groups in all major countries as well as regional activities on four continents. For the first time the collaboration of all these user groups has led to the organization of a world conference. Transputing 91.

Bit-level Systolic Arrays Anthony John De Groot, 1989 *The Application of a Sequence Notation to the Design of Systolic Computations* Rami Melhem, PITTSBURGH UNIV PA INST FOR COMPUTATIONAL MATHEMATICS AND APPLICATIONS., 1985 The sequence notation suggested in an earlier work provides a tool for the clear and precise

specification of systolic computations Namely it separates the static and dynamic levels of the specification At the static level the topology of the network and the function of each cell are described by a system of causal equations on sequences and at the dynamic level the data flow is described by the elements of the individual sequences This paper describes a method for the transformation of a given algorithm into a system of causal sequence equations input output description which specifies a systolic computation The basic idea of the method is to pack arrays of variables along one or more dimensions into sequences Doing this however may result in a system of equations that is not causal and hence a transformation of indices in the original algorithm may be essential in order to guarantee causality the positive increment of time
