## **Spatial Evolutionary Modeling:**

Spatial Evolutionary Modeling Roman Krzanowski, Jonathan Raper, 2001 Annotation Evolutionary models e.g genetic algorithms artificial life explored in other fields for the past two decades are now emerging as an important new tool in GIS for a number of reasons First they are highly appropriate for modeling geographic phenomena Secondly geographical problems are often spatially separate broken down into local or regional problems and evolutionary algorithms can exploit this structure Finally the ability to store manipulate and visualize spatial data has increased to the point that space time attribute databases can be easily handled

**Spatial Evolutionary Game Theory** Sungha Hwang, 2011 Evolutionary game theory has recently emerged as a key paradigm in various behavioral science disciplines In particular it provides powerful tools and a conceptual framework for the analysis of the time evolution of strategic interdependence among players and its consequences especially when the players are spatially distributed and linked in a complex social network We develop various evolutionary game models analyze these models using appropriate techniques and study their applications to complex phenomena In the second chapter we derive integro differential equations as deterministic approximations of the microscopic updating stochastic processes These generalize the known mean field

ordinary differential equations and provide powerful tools to investigate the spatial effects on the time evolutions of the agents strategy choices The deterministic equations allow us to identify many interesting features of the evolution of strategy profiles in a population such as standing and traveling waves and pattern formation especially in replicator type evolutions We introduce several methods of decomposition of two player normal form games in the third chapter Viewing the set of all games as a vector space we exhibit explicit orthonormal bases for the subspaces of potential games zero sum games and their orthogonal complements which we call anti potential games and anti zero sum games respectively Perhaps surprisingly every anti potential game comes either from Rock paper scissors type games in the case of symmetric games or from Matching Pennies type games in the case of asymmetric games Using these decompositions we prove old and some new cycle criteria for potential and zero sum games as orthogonality relations between subspaces We illustrate the usefulness of our decompositions by a analyzing the generalized Rock Paper Scissors game b completely characterizing the set of all null stable games c providing a large class of strict stable games d relating the game decomposition to the Hodge decomposition of vector fields for the replicator equations e constructing Lyapunov functions for some replicator dynamics f constructing Zeeman games games with an interior asymptotically stable Nash equilibrium and a pure strategy ESS The hierarchical modeling of evolutionary games provides flexibility in addressing the complex nature of social interactions as well as systematic frameworks in which one can keep track of the interplay of within group dynamics and between group competitions For example it can model husbands and wives interactions playing an asymmetric game with each other while engaging coordination problems with the likes in other families In the fourth chapter we provide hierarchical stochastic models of evolutionary games and approximations of these processes and study their applications

**The Development of an Integrated Planning and Decision Support System (IPDSS) for Land Consolidation** Demetris

Demetriou,2013-11-01 This book provides an extensive review of three interrelated issues land fragmentation land consolidation and land reallocation and it presents in detail the theoretical background design development and application of a prototype integrated planning and decision support system for land consolidation The system integrates geographic information systems GIS and artificial intelligence techniques including expert systems ES and genetic algorithms GAs with multi criteria decision methods MCDM both multi attribute MADM and multi objective MODM The system is based on four modules for measuring land fragmentation automatically generating alternative land redistribution plans evaluating those plans and automatically designing the land partitioning plan The presented research provides a new scientific framework for land consolidation planning both in terms of theory and practice by presenting new findings and by developing better tools and methods embedded in an integrated GIS environment It also makes a valuable contribution to the fields of GIS and spatial planning as it provides new methods and ideas that could be applied to improve the former for the benefit of the latter in the context of planning support systems From the 1960s ambitious research activities set out to observe regarding IT

support of the complex and time consuming redistribution processes within land consolidation without any practically relevant results until now This scientific work is likely to close that gap This distinguished publication is highly recommended to land consolidation planning experts researchers and academics alike Prof Dr Ing Joachim Thomas Münster Germany Planning support systems take new scientific tools based on GIS optimisation and simulation and use these to inform the process of plan making and policy This book is one of the first to show how this can be consistently done and it is a triumph of demonstrating how such systems can be made operational Essential reading for planners analysts and GI scientists Prof Michael Batty University College London
