**Stability in Coal Mining** C. O. Brawner, Ian P. F. Dorling, 1979      **Stability Analysis in Room and Pillar Coal Mining** Richard Wright, 1981 The research presented in this study is primarily concerned with the application of numerical modelling techniques to the stability analysis of coal mine structures The work has been limited to room and pillar coal mining of flat and gently dipping below 20 seams Conventional analytic techniques are described together with numerical and physical modelling techniques that are presently available The boundary element computer program DDSEAMS which has been used in this analysis is described in detail and the results of limited testing of the program are included A stress analysis design concept is presented which includes the development of a stress criterion for stability at a point Comparisons are made between the numerical model a 3 D physical model a base friction model and an underground phenomenological study at Grande Cache Alberta An illustration of the stress analysis design concept is included with reference to a proposed mine at Coal Valley Alberta This includes a detailed geotechnical testing program and the analysis of a number of alternative mine geometries The major conclusions are Improved stress analysis compared to conventional methods are obtained by using the numerical model presented Definition of a stress criterion is useful for the prediction of over stressed regions that are potentially unstable Where strata stress conditions or pillar safety factors indicate that failure will take place the use of elastic analysis techniques is not adequate for the definition of the overall stability The 3 D physical modelling qualitatively simulates pillar failures observed in the underground phenomenological study at Grande Cache Initial analysis indicates that extraction ratios greater than 50% may be possible by the punch mining method proposed at Coal Valley      *Strata Mechanics in Coal Mining* Michael L.
