Stellar Rotation:

The Rotation of Sun and Stars Jean-Pierre Rozelot, 2008-11-27 The Sun and stars rotate in different ways and at different velocity rates. The knowledge of how they rotate is important in understanding the formation and evolution of stars and their structure. The closest star to our Earth, the Sun, is a good laboratory to study in detail the rotation of a G star and allows to test new ideas and develop new techniques to study stellar rotation. More or less massive, more or less evolved objects, however, can have a very different rotation rate, structure, and history. In recent years, our understanding of the rotation of the Sun has greatly improved. The Sun has a well-known large-scale rotation which can be measured thanks to visible features across the solar disk, such as sunspots, or via spectroscopy. In addition, several studies cast light on differential rotation in the convective zone and on meridional circulation in the radiative zone of the Sun. Even the rotation of the core of the Sun can now be studied thanks to various methods, such as dynamics of the gravitational moments and, of course, helioseismology through g-modes analysis. Moreover, the magnetic field is strongly linked to the matter motions in the solar plasma. The solar magnetic field can be measured only at the surface or in the upper layers.

It is the product of the internal dynamo or of the local dynamos, if they exist, in any case, magnetic field and rotation cannot thus be separated.

Physics, Formation and Evolution of Rotating Stars Andre Maeder, 2008-12-19 Rotation is ubiquitous at each step of stellar evolution, from star formation to the final stages, and it affects the course of evolution, the timescales, and nucleosynthesis. Stellar rotation is also an essential prerequisite for the occurrence of Gamma Ray Bursts. In this book, the author thoroughly examines the basic mechanical and thermal effects of rotation, their influence on mass loss by stellar winds, the effects of differential rotation and its associated instabilities, the relation with magnetic fields, and the evolution of the internal and surface rotation. Further, he discusses the numerous observational signatures of rotational effects obtained from spectroscopy and interferometric observations, as well as from chemical abundance determinations, helioseismology, and asteroseismology, etc. On an introductory level, this book presents in a didactical way the basic concepts of stellar structure and evolution in track 1 chapters. The other, more specialized chapters, form an advanced course on the graduate level and will further serve as a valuable reference work for professional astrophysicists.

Stellar Rotation Arnold Hanslmeier, Roman Brajša, 2024-06-25 This textbook highlights mechanisms, properties, observations, and research progress of solar and stellar rotation. The rotation of stars is a basic parameter that enters into the dynamo mechanisms that generate stellar activity. The faster stars rotate, the higher the stellar activity. Moreover, the rotation can also be used to determine stellar ages. Only in the case of the Sun, we can directly observe details and therefore determine, e.g., the differential rotation. Thus, the Sun is a prototype for studying other stars. The textbook presents techniques that enable to determine rotation on stars and give a comparison of how stars rotate according to their spectral type and evolution. Special cases are given, such as rapidly rotating stars that are strongly deformed into ellipsoids. The textbook is intended for professionals and students in Astrophysics, as well as

readers interested in science in general

Studying Stellar Rotation and Convection Mariejo Goupil, Kévin Belkacem, Coralie Neiner, Francois Lignières, John J. Green, 2012-12-15 This volume synthesizes the results of work carried out by several international teams of the SIROCO Seismology for Rotation and Convection collaboration It provides the theoretical background required to interpret the huge quantity of high quality observational data recently provided by space experiments such as CoRoT and Kepler Asteroseismology allows astrophysicists to test to model and to understand stellar structure and evolution as never before The chapters in this book address the two groups of topics summarized as Stellar Rotation and Associated Seismology as well as Stellar Convection and Associated Seismology The book offers the reader solid theoretical background knowledge and adapted seismic diagnostic techniques

Exoplanets Sara Seager, 2011-01-15 For the first time in human history we know for certain the existence of planets around other stars Now the fastest growing field in space science the time is right for this fundamental source book on the topic which will lay the foundation for its continued growth Exoplanets serves as both an introduction for the non specialist and a foundation for the techniques and equations used in exoplanet observation by those dedicated to the field

Mass Loss from Stars and the Evolution of Stellar Clusters Alex de Koter, Linda Janet Smith, L. B. F. M. Waters, 2008 In the spring of 2006 a four day international workshop was held in Lunteren The Netherlands in honor of the formal retirement of Prof Henny Lamers These proceedings provide a comprehensive overview of mass loss in massive stars and of the dynamical fate of clusters The dynamical evolution of clusters is affected by stellar winds mass loss outbursts and supernova explosions as well as by the loss of stars in dynamical interactions thus linking the two central themes of the workshop It is becoming clear that mass loss by radiation pressure on spectral lines is not only at work in normal O B and A

stars but also in Luminous Blue Variables and Wolf Rayet stars The importance of these line driven winds relative to outbursts in the Luminous Blue Variable phase of evolution is under debate A central issue in this discussion is the importance of small and possibly large scale structure in stellar winds and its implications for the measured mass loss rates These proceedings report on progress establishing wind properties on theoretical predictions of mass loss and wind structure as a function of stellar properties and on the effects of mass loss on the evolution of massive stars As a result of dynamical interactions clusters may dissolve completely over time Observational studies of cluster dissolution timescales as a function of cluster formation history and cluster and environmental properties are at the focus of cluster studies in the last decade A key topic discussed in this book is whether the old globular clusters we observe today were once similar to present day massive young clusters The mass function of the two types of clusters is observed to be different Is this a result of dynamical evolution or were the mass functions different at formation The 12 invited reviews 18 contributed talks 48 poster papers and two discussion sessions combine to provide an in depth assessment of both observational and theoretical issues The book is suitable for researchers and graduate students interested in stellar astrophysics and cluster dynamics
