[Himalayan Glaciers](#) National Research Council,Division of Behavioral and Social Sciences and Education,Committee on Population,Division on Earth and Life Studies,Water Science and Technology Board,Board on Atmospheric Studies and Climate,Committee on Himalayan Glaciers, Hydrology, Climate Change, and Implications for Water Security,2012-11-29 Scientific evidence shows that most glaciers in South Asia s Hindu Kush Himalayan region are retreating but the consequences for the region s water supply are unclear this report finds The Hindu Kush Himalayan region is the location of several of Asia s great river systems which provide water for drinking irrigation and other uses for about 1 5 billion people Recent studies show that at lower elevations glacial retreat is unlikely to cause significant changes in water availability over the next several decades but other factors including groundwater depletion and increasing human water use could have a greater impact Higher elevation areas could experience altered water flow in some river basins if current rates of glacial retreat continue but shifts in the location intensity and variability of rain and snow due to climate change will likely have a greater impact on regional water supplies Himalayan Glaciers Climate Change Water Resources and Water Security makes recommendations and sets guidelines for the future of climate change and water security in the Himalayan Region This report emphasizes that social changes such as changing patterns of water use and water management decisions are likely to have at least as much of an impact on water demand as environmental factors do on water supply Water scarcity will likely affect the rural and urban poor most severely as these groups have the least capacity to move to new locations as needed It is predicted that the region will become

increasingly urbanized as cities expand to absorb migrants in search of economic opportunities As living standards and populations rise water use will likely increase for example as more people have diets rich in meat more water will be needed for agricultural use The effects of future climate change could further exacerbate water stress Himalayan Glaciers Climate Change Water Resources and Water Security explains that changes in the availability of water resources could play an increasing role in political tensions especially if existing water management institutions do not better account for the social economic and ecological complexities of the region To effectively respond to the effects of climate change water management systems will need to take into account the social economic and ecological complexities of the region This means it will be important to expand research and monitoring programs to gather more detailed consistent and accurate data on demographics water supply demand and scarcity The Atlas of Environmental Migration Dina Ionesco,Daria Mokhnacheva,François Gemenne,2016-11-25 As climate change and extreme weather events increasingly threaten traditional landscapes and livelihoods of entire communities the need to study its impact on human migration and population displacement has never been greater The Atlas of Environmental Migration is the first illustrated publication mapping this complex phenomenon It clarifies terminology and concepts draws a typology of migration related to environment and climate change describes the multiple factors at play explains the challenges and highlights the opportunities related to this phenomenon Through elaborate maps diagrams illustrations case studies from all over the world based on the most updated international research findings the Atlas guides the reader from the roots of environmental migration through to governance In addition to the primary audience of students and scholars of environment studies climate change geography and migration it will also be of interest to researchers and students in politics economics and international relations departments
