Stability Domains Lyubomir T. Gruyitch, Jean-Pierre Richard, Pierre Borne, Jean-Claude Gentina, 2003-12-15 *Stability Domains* is an up to date account of stability theory with particular emphasis on stability domains Beyond the fundamental basis of the theory of dynamical systems it includes recent developments in the classical Lyapunov stability concept practical stability properties and a new Lyapunov methodology for nonlinear systems It also introduces classical Lyapunov and practical stability theory for time invariant nonlinear systems in general and for complex interconnected large scale nonlinear dynamical systems in particular This is a complete treatment of the theory of stability domains useful for postgraduates and researchers working in this area of applied mathematics and engineering

Frequency Domain Criteria for Absolute stability Kumpati S. Narendra, 2014-01-16 *Frequency Domain Criteria for Absolute Stability* presents some generalizations of the well known Popov solution to the absolute stability problem proposed by Lur e and Postnikov in 1944 This book is divided into nine chapters that focus on the application of Lyapunov s direct method to generate frequency domain criteria for stability The first eight chapters explore the systems with a single nonlinear function or time varying parameter These chapters also discuss the development of stability criteria for these systems the sufficiency theorems and Lyapunov function Some of the theorems applied to a damped version of the Mathieu equation and to a nonlinear equation derived from it are also covered The concluding chapter deals with systems with multiple nonlinearities or time varying gains This chapter also outlines the basic definitions and tools as well as the derivation of stability criteria This work will serve as a reference for research courses concerning stability problems related to the absolute stability problem of Lur e and Postnikov Engineers and applied mathematicians will also find this book invaluable

Universality in Chaos Predrag Cvitanović, 1989 Nature provides many

examples of physical systems that are described by deterministic equations of motion but that nevertheless exhibit nonpredictable behavior The detailed description of turbulent motions remains perhaps the outstanding unsolved problem of classical physics In recent years however a new theory has been formulated that succeeds in making quantitative predictions describing certain transitions to turbulence Its significance lies in its possible application to large classes often very dissimilar of nonlinear systems Since the publication of *Universality in Chaos* in 1984 progress has continued to be made in our understanding of nonlinear dynamical systems and chaos This second edition extends the collection of articles to cover recent developments in the field including the use of statistical mechanics techniques in the study of strange sets arising in dynamics It concentrates on the universal aspects of chaotic motions the qualitative and quantitative predictions that apply to large classes of physical systems Much like the previous edition this book will be an indispensable reference for researchers and graduate students interested in chaotic dynamics in the physical biological and mathematical sciences as well as engineering
