STUDIES IN DIGITAL COMMUNICATIONS. PART I. FEASIBILITY OF ASYNCHRONOUS MULTIPLEXING. PART II. PERFORMANCE OF HIGH-SPEED DIGITAL COMMUNICATIONS OVER TROPOSCATTER LINKS M P ISTENBATT,1963 Part I describes experiments and calculations aimed at demonstrating the feasibility of asyn chronous time multiplexing for multichannel speech The work here generally served to elaborate on the theoretical analysis and pre dictions made previously and demonstrated them in the laboratory The experiments tested vari ous aspects of the method and culminated in a realistic multichannel experiment with external coded speech signals The major feasibility demonstrations were done by using a digital com puter with A D equipment However an analog extremal coding system was built in order to demonstrate the

equipment simplicity The work here showed that asynchronous time multiplexing is feasible under the conditions treated for systems having as few as 24 sources It is concluded that the advantage of this method over synchronously multiplexed PCM is about 2.7 for 100 sources and 2.1 and 24 sources Increases in this advantage should be possible with system improvements The speech quality with this advantage is not distinguishable with casual listening from that of the usual PCM
